GENERAL DESCRIPTION

The **ADG211A** and **ADG212A** are monolithic CMOS devices comprising four independently selectable switches. They are designed on an enhanced LC²MOS process, which gives an increased signal handling capability of ±15 V. These switches also feature high switching speeds and low R_{ON} .

The **ADG211A** and **ADG212A** consist of four SPST switches. They differ only in that the digital control logic is inverted. In multiplexer applications, all switches exhibit break-before-make switching action when driven simultaneously. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

PRODUCT HIGHLIGHTS

1. **Extended Signal Range.**
These switches are fabricated on an enhanced LC²MOS process, resulting in high breakdown and an increased analog signal range of ±15 V.
2. **Single Supply Operation.**
For applications where the analog signal is unipolar (0 V to 15 V), the switches can be operated from a single 15 V supply.
3. **Low Leakage.**
Leakage currents in the range of 500 pA make these switches suitable for high precision circuits. The added feature of break-before-make allows for multiple outputs to be tied together for multiplexer applications while keeping leakage errors to a minimum.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
