

■ General Description

The AME8827 family of positive, CMOS linear regulators and provide low dropout voltage (340mV @ 1A) and excellent PSRR, thus making them ideal for power-saving systems. These rugged devices have both Thermal Shutdown, and Current limit to prevent device failure under the "Worst" of operating conditions.

The AME8827 is stable with an output capacitance of 4.7 μ F or larger.

■ Features

- Low Dropout Voltage:340mV @ 1A
- Guaranteed 1A Drive current
- Over-Temperature Shutdown
- Current Limiting protection
- Excellent PSRR : 60dB(typ.)
- Factory Pre-set Output Voltages
- Low Temperature Coefficient
- Input Voltage Range (2.5V - 5.5V)
- Output Voltage Range (1.2V - 3.6V)
- All AME's Green Products Meet RoHS Standards

■ Applications

- Motherboard, Desktop, and Computer Peripherals
- LCD monitor
- Handheld Device
- Data-communication

■ Pin Description

Pin Name	Pin Description
IN	Input voltage pin; should be decoupled with 1 μ F or greater capacitor.
GND	Ground connection pin.
OUT	LDO voltage regulator output pin; should be decoupled with a 4.7 μ F or greater value low ESR ceramic capacitor.

Note:

1. The first 2 places represent product code. It is assigned by AME such as AK.
2. y is year code and is the last number of a year. Such as the year code of 2008 is 8.
3. A bar on top of first letter represents Green Part such as A8827.
4. The last 3 places MXX represent Marking Code. It contains M as date code in "month", XX as LN code and that is for AME internal use only. Please refer to date code rule section for detail information.
5. Please consult AME sales office or authorized Rep./Distributor for the availability of output voltage and package type.

Note 1: $V_{IN(MIN)} = V_{OUT} + V_{DROP}$ or $V_{IN(min)} = 2.5V$, whichever is greater.

Note 2: For V_{OUT} below 2.0V, Dropout Voltage is the input to output differential.

■ Detailed Description

The AME8827 is low-dropout; low quiescent current linear regulator designed for motherboard, notebook and LCD monitor applications. The output voltage range from 1.2V to 3.6V, and can drive 1A loading current.

Capacitor Selection and Regulator Stability

Use 1μF for input capacitor and 4.7μF for great for output capacitor on the AME8827. Larger input capacitor value and low ESR provide better supply noise rejection and improve line transient response. To reduce output noise and load transient response, use output capacitor greater than 4.7μF.

Calculating the Maximum Output Power

The maximum output power of the AME8827 is limited by the maximum power dissipation of the package. By calculation the power dissipation of the package as a function of the input voltage, output voltage and output current, the maximum input voltage can be obtained. The maximum power dissipation should not exceed the package's maximum power rating.

$$P_{MAX} = (V_{IN,MAX} - V_{OUT}) \times I_{OUT}$$

Where:

$V_{IN,MAX}$ = maximum input voltage

P_{MAX} = maximum power dissipation of the package
