

PSSO36 (slug up)

Features

- Multipower BCD technology
- Minimum input/output pulse width distortion
- 150 mΩ $R_{DS(on)}$ complementary DMOS output stage
- CMOS compatible logic inputs
- Thermal protection
- Thermal warning output
- Undervoltage protection
- Short-circuit protection

Description

The STA510A is a monolithic, quad, half-bridge stage in multipower BCD technology. The device can be used as dual-bridge or reconfigured, by connecting the CONFIG pin to the VDD pin, as single-bridge with double current capability, or as half-bridge (binary mode) with half current capability.

The device is particularly designed to make the output stage of a stereo all-digital high-efficiency (DDX) amplifier, which employs a pulse-width modulator driver. The STA510A is capable of delivering an output power of 50 W into 3 Ω loads with THD = 10% and $V_{CC} = 36$ V. In single BTL configuration the device can deliver 200 W into a 3 Ω load with THD = 10% and $V_{CC} = 36$ V.

The input pins have a threshold proportional to V_L pin voltage.

Table 2. Pin list

Pin	Name	Description
1	GND-SUB	Substrate ground
2, 3	OUT2B	Output half-bridge 2B
4	V _{CC} 2B	Positive supply
5	GND2B	Negative supply
6	GND2A	Negative supply
7	V _{CC} 2A	Positive supply
8, 9	OUT2A	Output half-bridge 2A
10, 11	OUT1B	Output half-bridge 1B
12	V _{CC} 1B	Positive supply
13	GND1B	Negative supply
14	GND1A	Negative supply
15	V _{CC} 1A	Positive supply
16, 17	OUT1A	Output half-bridge 1A
18	NC	Not connected

Table 2. Pin list (continued)

Pin	Name	Description
19	GND-clean	Logical ground
20	GND-Reg	Ground for regulator V_{DD}
21, 22	V_{DD}	5-V regulator referred to ground
23	V_L	High logical state setting voltage
24	CONFIG	Configuration 0: normal operation 1: single BTL (mono) mode, join the pins OUT1A to OUT1B and OUT2A to OUT2B (if IN1A is joined to IN1B and IN2A to IN2B)
25	PWRDN	Standby (power down): 0: low power consumption mode 1: normal operation
26	TRI-STATE	High impedance control: 0: all power amplifiers in high-impedance state 1: normal operation
27	FAULT ⁽¹⁾	Fault advisor: 0: fault detected (short circuit or thermal) 1: normal operation
28	TH-WAR	Thermal warning advisor: 0: junction temperature = 130 °C 1: normal operation
29	IN1A	Input of half-bridge 1A
30	IN1B	Input of half-bridge 1B
31	IN2A	Input of half-bridge 2A
32	IN2B	Input of half-bridge 2B
33, 34	V_{SS}	5-V regulator referred to $+V_{CC}$
35, 36	VCCSIGN	Signal positive supply
-	EP	Exposed pad up

1. The pin is open collector. To have a high logic value it needs to be pulled up by a resistor.

3 Electrical specifications

3.1 Absolute maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage (pin 4, 7, 12, 15)	44	V
V_{max}	Maximum voltage on pins 23 to 32	5.5	V
P_{tot}	Power dissipation ($T_{case} = 70\text{ °C}$)	21	W
T_{op}	Operating temperature range	90	°C
T_{stg}, T_j	Storage and junction temperature	-40 to 150	°C

3.2 Recommended operating conditions

Table 4. Recommended operating conditions⁽¹⁾

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{CC}	DC supply voltage	10		39.0	V
V_L	Input logic reference	2.7	3.3	5.0	V
T_{amb}	Ambient temperature	0		70	°C

1. Performance not guaranteed beyond recommended operating conditions.

3.3 Thermal data

The power dissipated within the device depends primarily on the supply voltage, load impedance and output modulation level. The PowerSO36 package of the STA510A includes an exposed pad or slug on the top of the device to provide a direct thermal path from the die to the heatsink.

Table 5. Thermal data

Symbol	Parameter	Min.	Typ.	Max.	Unit
T_{j-case}	Thermal resistance junction to case (thermal pad)		1	2.5	°C/W
T_{jSD}	Thermal shut-down junction temperature		150		°C
T_{warn}	Thermal warning temperature		130		°C
t_{hSD}	Thermal shutdown hysteresis		25		°C

3.4 Electrical specifications

The results in [Table 6](#) below are given for the conditions: $V_L = 3.3\text{ V}$, $V_{CC} = 36\text{ V}$, $R_L = 8\ \Omega$, $f_{sw} = 384\text{ kHz}$ and $T_{amb} = 25\text{ °C}$ unless otherwise specified. See also [Figure 3](#).

Table 6. Electrical specifications

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
R_{dsON}	Power P-channel/N-channel MOSFET $R_{DS(on)}$	$I_d = 1\text{ A}$		150	200	m Ω
I_{dss}	Power P-channel/N-channel leakage current				100	μA
g_N	Power P-channel $R_{DS(on)}$ matching	$I_d = 1\text{ A}$	95			%
g_P	Power N-channel $R_{DS(on)}$ matching	$I_d = 1\text{ A}$	95			%
Dt_s	Low current deadtime (static)	See test circuit Figure 3		10	20	ns
Dt_d	High current deadtime (dynamic)	$L = 22\ \mu\text{H}$, $C = 470\text{ nF}$, $R_L = 8\ \Omega$, $I_d = 3\text{ A}$, see test circuit Figure 5			50	ns
$t_{d\ ON}$	Turn-on delay time	Resistive load, $V_{CC} = 30\text{ V}$			100	ns
$t_{d\ OFF}$	Turn-off delay time	Resistive load, $V_{CC} = 30\text{ V}$			100	ns
t_r	Rise time	Resistive load, as Figure 3			25	ns
t_f	Fall time	Resistive load, as Figure 3			25	ns
$V_{IN-High}$	High level input voltage				$V_L/2 + 300\text{ mV}$	V
V_{IN-Low}	Low level input voltage		$V_L/2 - 300\text{ mV}$			V
I_{IN-H}	High level input current	Pin voltage = V_L		1		μA
I_{IN-L}	Low level input current	Pin voltage = 0.3 V		1		μA
$I_{PWRDN-H}$	High level PWRDN pin input current	$V_L = 3.3\text{ V}$		35		μA
V_{Low}	Low logical state voltage (pins PWRDN, TRISTATE)	$V_L = 2.7\text{ V}$			0.70	V
		$V_L = 3.3\text{ V}$			0.80	
		$V_L = 5.0\text{ V}$			0.85	
V_{High}	High logical state voltage (pins PWRDN, TRISTATE)	$V_L = 2.7\text{ V}$	1.50			V
		$V_L = 3.3\text{ V}$	1.7			V
		$V_L = 5.0\text{ V}$	1.85			V
$I_{VCC-PWRDN}$	Supply current from V_{CC} in power down	PWRDN = 0			3	mA
I_{FAULT}	Output current pins FAULT -TH-WARN when FAULT CONDITIONS	$V_{PIN} = 3.3\text{ V}$		1		mA
$I_{VCC-hiz}$	Supply current from V_{CC} in tri-state	$V_{CC} = 30\text{ V}$, Pin TRI-STATE = 0		22		mA

Table 6. Electrical specifications (continued)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
I_{VCC}	Supply current from V_{CC} in operation both channel switching)	$V_{CC} = 30\text{ V}$, input pulse width duty cycle = 50%, switching frequency = 384 kHz, no LC filters;		70		mA
I_{SCP}	Short-circuit current limit		5.5	6		A
V_{UV}	Undervoltage protection threshold			7		V
t_{pw_min}	Output minimum pulse width	No load	25		40	ns
ESD	ESD maximum withstanding voltage range, test condition CDF-AEC-Q100-002-"Human Body Model"		± 1500			V

4 Technical information

The STA510A is a dual channel H-bridge that is able to deliver 100 W per channel (into $R_L = 6\ \Omega$ with THD = 10% and $V_{CC} = 36\text{ V}$) of audio output power very efficiently. It operates in conjunction with a pulse-width modulator driver such as the STA321 or STA309A.

The STA510A converts ternary-, phase-shift- or binary-controlled PWM signals into audio power at the load. It includes a logic interface, integrated bridge drivers, high efficiency MOSFET outputs and thermal and short-circuit protection circuitry. In differential mode (ternary, phase-shift or binary differential), two logic level signals per channel are used to control high-speed MOSFET switches to connect the speaker load to the input supply or to ground in a bridge configuration, according to the damped ternary modulation operation.

In binary mode, both full bridge and half bridge modes are supported. The STA510A includes overcurrent and thermal protection as well as an undervoltage lockout with automatic recovery. A thermal warning status is also provided.

Figure 6. Block diagram of full-bridge DDX® or binary mode

Figure 7. Block diagram of f binary half-bridge mode

4.1 Logic interface and decode

The STA510A power outputs are controlled using one or two logic-level timing signals. In order to provide a proper logic interface, the VL input must operate at the same voltage as the DDX control logic supply.

4.2 Protection circuitry

The STA510A includes protection circuitry for overcurrent and thermal overload conditions. A thermal warning pin (THWARN, pin 28, open drain MOSFET) is activated low when the IC temperature exceeds 130 °C, just in advance of thermal shutdown. When a fault condition is detected an internal fault signal immediately disables the output power MOSFETs, placing both H-bridges in a high-impedance state. At the same time the open-drain MOSFET of pin FAULT (pin 27) is switched on.

There are two possible modes subsequent to activating a fault.

- **Shutdown mode:** with pins FAULT (with pull-up resistor) and TRISTATE separate, an activated fault disables the device, signalling a low at pin FAULT output. The device may subsequently be reset to normal operation by toggling pin TRISTATE from high to low to high using an external logic signal.
- **Automatic recovery mode:** This is shown in the applications circuits below where pins FAULT and TRISTATE are connected together to a time-constant circuit (R59 and C58). An activated fault forces a reset on pin TRISTATE causing normal operation to resume following a delay determined by the time constant of the circuit. If the fault condition persists, the circuit operation repeats until the fault condition is cleared. An increase in the time constant of the circuit produces a longer recovery interval. Care must be taken in the overall system design not to exceed the protection thresholds under normal operation.

4.3 Power outputs

The STA510A power and output pins are duplicated to provide a low-impedance path for the device bridged outputs. All duplicate power, ground and output pins must be connected for proper operation.

The PWRDN or TRISTATE pin should be used to set all power MOSFETs to the high-impedance state during power-up until the logic power supply, VL, has settled.

4.4 Parallel output / high current operation

When using the DDX mode output, the STA510A outputs can be connected in parallel in order to increase the output current capability to a load. In this configuration the STA510A can provide up to 200 W into a 3-Ω load.

This mode of operation is enabled with the pin CONFIG (pin 24) connected to pin VDD. The inputs are joined so that IN1A = IN1B, IN2A = IN2B and similarly the outputs OUT1A = OUT1B, OUT2A = OUT2B as shown in [Figure 9](#).

4.5 Output filtering

A passive 2nd-order filter is used on the STA510A power outputs to reconstruct the analog audio signal. System performance can be significantly affected by the output filter design and choice of passive components. A filter design for 6- or 8-Ω loads is shown in the application circuit of [Figure 8](#), and for 4-Ω loads in [Figure 9](#) and [Figure 10](#).

4.6 Application circuits

Figure 8. Typical stereo full bridge configuration for up to 2x 100 W

Figure 9. Typical single BTL configuration for up to 180 W

The power estimations were made using the STA321+STA510A demo board. The peak power duration is for $t \leq 1$ s.

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.
