

EMI2124

Single Pair Common Mode Filter with ESD Protection

Description

The EMI2124 is an integrated common mode filter providing both ESD protection and EMI filtering for high speed serial digital interfaces such as USB2.0.

The EMI2124 provides EMI filtering for one differential data line pair and ESD protection for one data pair plus USB ID pin. It provides a separate Vbus line protection typically used for charging. It is supplied in a small RoHS-compliant WDFN8 package.

Features

- Highly Integrated Common Mode Filter (CMF) with ESD Protection provides protection and EMI Reduction for systems using high speed Serial Data Lines with cost and space savings over Discrete Solutions
- Large Differential Mode Bandwidth with Cutoff Frequency > 2 GHz
- High Common Mode Stop Band Attenuation: >25 dB at 700 MHz, >30 dB at 800 MHz Typical
- Provides Data Lines ESD Protection to IEC61000-4-2 Level 4, ± 12 kV Contact Discharge
- Provides V_{ID} & V_{BUS} ESD Protection to IEC61000-4-2 Level 4, ± 30 kV Contact Discharge
- Low Channel Input Capacitance provides Superior Impedance Matching Performance
- Low Profile Package with Small Footprint in WDFN8 2.0 mm length x 2.2 mm width x 0.75 mm height Pb-Free Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- USB2.0 and other High Speed Differential Data Lines in Mobile Phones and Digital Still Cameras
- MIPI D-PHY

1. Standard IEC 61000–4–2 with $C_{Discharge} = 150\text{ pF}$, $R_{Discharge} = 330$, GND grounded.
2. These measurements performed with no external capacitor.
3. TVS devices are normally selected according to the working peak reverse voltage (V_{RWM}), which should be equal or greater than the DC or continuous peak operating voltage level.
4. V_{BR} is measured at pulse test current I_T .

Transmission Line Pulse (TLP) Measurements

Transmission Line Pulse (TLP) provides current versus voltage (I-V) curves in which each data point is obtained from a 100 ns long rectangular pulse from a charged transmission line. A simplified schematic of a typical TLP system is shown in Figure 8. TLP I-V curves of ESD protection devices accurately demonstrate the product's ESD capability because the 10 s of amps current levels and under 100 ns time scale match those of an ESD event. This is illustrated in Figure 9 where an 8 kV IEC61000-4-2 current waveform is compared with TLP current pulses at 8 and 16 A. A TLP curve shows the voltage at which the device turns on as well as how well the device clamps voltage over a range of current levels. Typical TLP I-V curves for the EMI2124 are shown in Figure 10.

ESD Voltage Clamping

For sensitive circuit elements it is important to limit the voltage that an IC will be exposed to during an ESD event to as low a voltage as possible. The ESD clamping voltage is the voltage drop across the ESD protection diode during an ESD event per the IEC61000-4-2 waveform. Since the IEC61000-4-2 was written as a pass/fail spec for larger systems such as cell phones or laptop computers it is not clearly defined in the spec how to specify a clamping voltage at the device level. ON Semiconductor has developed a way to examine the entire voltage waveform across the ESD protection diode over the time domain of an ESD pulse in the form of an oscilloscope screenshot, which can be found on the datasheets for all ESD protection diodes. For more information on how ON Semiconductor creates these screenshots and how to interpret them please refer to On Semiconductor Application Notes AND8307/D and AND8308/D.
