

Access line, 16 MHz STM8S 8-bit MCU, up to 32 Kbyte Flash, integrated EEPROM, 10-bit ADC, timers, UART, SPI, I<sup>2</sup>C

Datasheet - production data

## Features

### Core

- 16 MHz advanced STM8 core with Harvard architecture and 3-stage pipeline
- Extended instruction set

### Memories

- Program memory: up to 32 Kbyte Flash; data retention 20 years at 55 °C after 10 kcycle
- Data memory: up to 1 Kbyte true data EEPROM; endurance 300 kcycle
- RAM: up to 2 Kbyte

### Clock, reset and supply management

- 2.95 to 5.5 V operating voltage
- Flexible clock control, 4 master clock sources
  - Low power crystal resonator oscillator
  - External clock input
  - Internal, user-trimmable 16 MHz RC
  - Internal low-power 128 kHz RC
- Clock security system with clock monitor
- Power management:
  - Low-power modes (wait, active-halt, halt)
  - Switch-off peripheral clocks individually
- Permanently active, low-consumption power-on and power-down reset

### Interrupt management

- Nested interrupt controller with 32 interrupts
- Up to 37 external interrupts on 6 vectors

### Timers

- Advanced control timer: 16-bit, 4 CAPCOM channels, 3 complementary outputs, dead-time insertion and flexible synchronization

- 2x16-bit general purpose timer, with 2+3 CAPCOM channels (IC, OC or PWM)
- 8-bit basic timer with 8-bit prescaler
- Auto wake-up timer
- Window watchdog and independent watchdog timers

### Communication interfaces

- UART with clock output for synchronous operation, SmartCard, IrDA, LIN master mode
- SPI interface up to 8 Mbit/s
- I2C interface up to 400 kbit/s

### Analog to digital converter (ADC)

- 10-bit,  $\pm 1$  LSB ADC with up to 10 multiplexed channels, scan mode and analog watchdog

### I/Os

- Up to 38 I/Os on a 48-pin package including 16 high sink outputs
- Highly robust I/O design, immune against current injection

### Unique ID

- 96-bit unique key for each device

# 1 Introduction

This datasheet contains the description of the device features, pinout, electrical characteristics, mechanical data and ordering information.

- For complete information on the STM8S microcontroller memory, registers and peripherals, please refer to the STM8S microcontroller family reference manual (RM0016).
- For information on programming, erasing and protection of the internal Flash memory please refer to the STM8S Flash programming manual (PM0051).
- For information on the debug and SWIM (single wire interface module) refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).
- For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

## 2 Description

The STM8S105x4/6 access line 8-bit microcontrollers offer from 16 to 32 Kbyte Flash program memory, plus integrated true data EEPROM. The STM8S microcontroller family reference manual (RM0016) refers to devices in this family as medium-density. All devices of the STM8S105x4/6 access line provide the following benefits: reduced system cost, performance and robustness, short development cycles, and product longevity.

The system cost is reduced thanks to an integrated true data EEPROM for up to 300 k write/erase cycles and a high system integration level with internal clock oscillators, watchdog and brown-out reset.

Device performance is ensured by a 16 MHz CPU clock frequency and enhanced characteristics which include robust I/O, independent watchdogs (with a separate clock source), and a clock security system.

Short development cycles are guaranteed due to application scalability across common family product architecture with compatible pinout, memory map and modular peripherals.

Product longevity is ensured in the STM8S family thanks to their advanced core which is made in a state-of-the-art technology for applications with 2.95 V to 5.5 V operating supply.

Full documentation is offered as well as a wide choice of development tools.

Table 1. STM8S105x4/6 access line features

| Device                                     | STM8S105C6                                                                                                                                 | STM8S105C4 | STM8S105S6 | STM8S105S4 | STM8S105K6 | STM8S105K4 |

### 3 Block diagram

Figure 1. STM8S105x4/6 block diagram

## 4 Product overview

The following section provides an overview of the basic features of the device functional modules and peripherals.

For more detailed information please refer to the corresponding family reference manual (RM0016).

### 4.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

#### Architecture and registers

- Harvard architecture,
- 3-stage pipeline,
- 32-bit wide program memory bus - single cycle fetching for most instructions,
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations,
- 8-bit accumulator,
- 24-bit program counter - 16-Mbyte linear memory space,
- 16-bit stack pointer - access to a 64 K-level stack,
- 8-bit condition code register - 7 condition flags for the result of the last instruction.

#### Addressing

- 20 addressing modes,
- Indexed indirect addressing mode for look-up tables located anywhere in the address space,
- Stack pointer relative addressing mode for local variables and parameter passing.

#### Instruction set

- 80 instructions with 2-byte average instruction size,
- Standard data movement and logic/arithmetic functions,
- 8-bit by 8-bit multiplication,
- 16-bit by 8-bit and 16-bit by 16-bit division,
- Bit manipulation,
- Data transfer between stack and accumulator (push/pop) with direct stack access,
- Data transfer using the X and Y registers or direct memory-to-memory transfers.

## 4.2 Single wire interface module (SWIM) and debug module (DM)

The single wire interface module and debug module permits non-intrusive, real-time in-circuit debugging and fast memory programming.

### SWIM

Single wire interface module for direct access to the debug module and memory programming. The interface can be activated in all device operation modes. The maximum data transmission speed is 145 bytes/ms.

### Debug module

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, also CPU operation can be monitored in real-time by means of shadow registers.

- R/W to RAM and peripheral registers in real-time
- R/W access to all resources by stalling the CPU
- Breakpoints on all program-memory instructions (software breakpoints)
- Two advanced breakpoints, 23 predefined configurations

## 4.3 Interrupt controller

- Nested interrupts with three software priority levels,
- 32 interrupt vectors with hardware priority,
- Up to 37 external interrupts on 6 vectors including TLI,
- Trap and reset interrupts

## 4.4 Flash program and data EEPROM memory

- Up to 32 Kbyte of Flash program single voltage Flash memory,
- Up to 1 Kbyte true data EEPROM,
- Read while write: writing in data memory possible while executing code in program memory,
- User option byte area.

### Write protection (WP)

Write protection of Flash program memory and data EEPROM is provided to avoid unintentional overwriting of memory that could result from a user software malfunction.

There are two levels of write protection. The first level is known as MASS (memory access security system). MASS is always enabled and protects the main Flash program memory, data EEPROM and option bytes.

To perform in-application programming (IAP), this write protection can be removed by writing a MASS key sequence in a control register. This allows the application to write to data EEPROM, modify the contents of main program memory or the device option bytes.

A second level of write protection, can be enabled to further protect a specific area of memory known as UBC (user boot code). Refer to the figure below.

The size of the UBC is programmable through the UBC option byte, in increments of 1 page (512 byte) by programming the UBC option byte in ICP mode.

This divides the program memory into two areas:

- Main program memory: up to 32 Kbyte minus UBC
- User-specific boot code (UBC): Configurable up to 32 Kbyte

The UBC area remains write-protected during in-application programming. This means that the MASS keys do not unlock the UBC area. It protects the memory used to store the boot program, specific code libraries, reset and interrupt vectors, the reset routine and usually the IAP and communication routines.

**Figure 2. Flash memory organization**

### Read-out protection (ROP)

The read-out protection blocks reading and writing the Flash program memory and data EEPROM memory in ICP mode (and debug mode). Once the read-out protection is activated, any attempt to toggle its status triggers a global erase of the program and data memory. Even if no protection can be considered as totally unbreakable, the feature provides a very high level of protection for a general purpose microcontroller.

## 4.5 Clock controller

The clock controller distributes the system clock (fMASTER) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

### Features

- **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **Master clock sources:** four different clock sources can be used to drive the master clock:
  - 1-16 MHz high-speed external crystal (HSE)
  - Up to 16 MHz high-speed user-external clock (HSE user-ext)
  - 16 MHz high-speed internal RC oscillator (HSI)
  - 128 kHz low-speed internal RC (LSI)
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If an HSE clock failure occurs, the internal RC (16 MHz/8) is automatically selected by the CSS and an interrupt can optionally be generated.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

Table 2. Peripheral clock gating bit assignments in CLK\_PCKENR1/2 registers

| Bit     | Peripheral clock | Bit     | Peripheral clock | Bit     | Peripheral clock | Bit     | Peripheral clock |
|---------|------------------|---------|------------------|---------|------------------|---------|------------------|
| PCKEN17 | TIM1             | PCKEN13 | UART2            | PCKEN27 | Reserved         | PCKEN23 | ADC              |
| PCKEN16 | TIM3             | PCKEN12 | Reserved         | PCKEN26 | Reserved         | PCKEN22 | AWU              |
| PCKEN15 | TIM2             | PCKEN11 | SPI              | PCKEN25 | Reserved         | PCKEN21 | Reserved         |
| PCKEN14 | TIM4             | PCKEN10 | I2C              | PCKEN24 | Reserved         | PCKEN20 | Reserved         |

## 4.6 Power management

For efficient power management, the application can be put in one of four different low-power modes. You can configure each mode to obtain the best compromise between lowest power consumption, fastest start-up time and available wakeup sources.

- **Wait mode:** In this mode, the CPU is stopped, but peripherals are kept running. The wakeup is performed by an internal or external interrupt or reset.
- **Active halt mode with regulator on:** In this mode, the CPU and peripheral clocks are stopped. An internal wakeup is generated at programmable intervals by the auto wake up unit (AWU). The main voltage regulator is kept powered on, so current consumption is higher than in active halt mode with regulator off, but the wakeup time is faster. Wakeup is triggered by the internal AWU interrupt, external interrupt or reset.
- **Active halt mode with regulator off:** This mode is the same as active halt with regulator on, except that the main voltage regulator is powered off, so the wake up time is slower.
- **Halt mode:** In this mode the microcontroller uses the least power. The CPU and peripheral clocks are stopped, the main voltage regulator is powered off. Wakeup is triggered by external event or reset.

## 4.7 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

Activation of the watchdog timers is controlled by option bytes or by software. Once activated, the watchdogs cannot be disabled by the user program without performing a reset.

### Window watchdog timer

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

The window function can be used to trim the watchdog behavior to match the application perfectly.

The application software must refresh the counter before time-out and during a limited time window.

A reset is generated in two situations:

1. **Timeout:** At 16 MHz CPU clock the time-out period can be adjusted between 75  $\mu$ s up to 64 ms.
2. **Refresh out of window:** The downcounter is refreshed before its value is lower than the one stored in the window register.

### Independent watchdog timer

The independent watchdog peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 128 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure

The IWDG time base spans from 60  $\mu$ s to 1 s.

## 4.8 Auto wakeup counter

- Used for auto wakeup from active halt mode,
- Clock source: Internal 128 kHz internal low frequency RC oscillator or external clock,
- LSI clock can be internally connected to TIM1 input capture channel 1 for calibration.

## 4.9 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

The beeper output port is only available through the alternate function remap option bit AFR7.

## 4.10 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- Four independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Synchronization module to control the timer with external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Encoder mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update, 1 x break

## 4.11 TIM2, TIM3 - 16-bit general purpose timers

- 16-bit auto reload (AR) up-counter
- 15-bit prescaler adjustable to fixed power of 2 ratios 1...32768
- Timers with 3 or 2 individually configurable capture/compare channels
- PWM mode
- Interrupt sources: 2 or 3 x input capture/output compare, 1 x overflow/update

## 4.12 TIM4 - 8-bit basic timer

- 8-bit auto reload, adjustable prescaler ratio to any power of 2 from 1 to 128
- Clock source: CPU clock
- Interrupt source: 1 x overflow/update

Table 3. TIM timer features

| Timer | Counter size (bits) | Prescaler                      | Counting mode | CAPCOM channels | Complementary outputs | Ext. trigger | Timer synchronization/ chaining |
|-------|---------------------|--------------------------------|---------------|-----------------|-----------------------|--------------|---------------------------------|
| TIM1  | 16                  | Any integer from 1 to 65536    | Up/down       | 4               | 3                     | Yes          | No                              |
| TIM2  | 16                  | Any power of 2 from 1 to 32768 | Up            | 3               | 0                     | No           |                                 |
| TIM3  | 16                  | Any power of 2 from 1 to 32768 | Up            | 2               | 0                     | No           |                                 |
| TIM4  | 8                   | Any power of 2 from 1 to 128   | Up            | 0               | 0                     | No           |                                 |

## 4.13 Analog-to-digital converter (ADC1)

The STM8S105x4/6 products contain a 10-bit successive approximation A/D converter (ADC1) with up to 10 multiplexed input channels and the following main features:

- Input voltage range: 0 to VDD
- Conversion time: 14 clock cycles
- Single and continuous and buffered continuous conversion modes
- Buffer size (n x 10 bits) where n = number of input channels
- Scan mode for single and continuous conversion of a sequence of channels
- Analog watchdog capability with programmable upper and lower thresholds
- Analog watchdog interrupt
- External trigger input
- Trigger from TIM1 TRGO
- End of conversion (EOC) interrupt

*Note: Additional AIN12 analog input is not selectable in ADC scan mode or with analog watchdog. Values converted from AIN12 are stored only into the ADC\_DRH/ADC\_DRL registers.*

## 4.14 Communication interfaces

The following communication interfaces are implemented:

- UART1: Full feature UART, synchronous mode, SPI master mode, Smartcard mode, IrDA mode, single wire mode, LIN2.1 master capability
- SPI: Full and half-duplex, 8 Mbit/s
- I<sup>2</sup>C: Up to 400 kbit/s

### 4.14.1 UART2

#### Main features

- 1 Mbit/s full duplex SCI
- SPI emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- LIN master mode
- LIN slave mode

#### Asynchronous communication (UART mode)

- Full duplex communication - NRZ standard format (mark/space)
- Programmable transmit and receive baud rates up to 1 Mbit/s (fCPU/16) and capable of following any standard baud rate regardless of the input frequency
- Separate enable bits for transmitter and receiver
- Two receiver wakeup modes:
  - Address bit (MSB)
  - Idle line (interrupt)
- Transmission error detection with interrupt generation
- Parity control

#### Synchronous communication

- Full duplex synchronous transfers
- SPI master operation
- 8-bit data communication
- Maximum speed: 1 Mbit/s at 16 MHz (fCPU/16)

#### LIN master mode

- Emission: Generates 13-bit synch. break frame
- Reception: Detects 11-bit break frame

**LIN slave mode**

- Autonomous header handling - one single interrupt per valid message header
- Automatic baud rate synchronization - maximum tolerated initial clock deviation  $\pm 15\%$
- Synch delimiter checking
- 11-bit LIN synch break detection - break detection always active
- Parity check on the LIN identifier field
- LIN error management
- Hot plugging support

**4.14.2 SPI**

- Maximum speed: 8 Mbit/s ( $f_{MASTER}/2$ ) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave/master selection input pin

**4.14.3 I<sup>2</sup>C**

- I<sup>2</sup>C master features:
  - Clock generation
  - Start and stop generation
- I<sup>2</sup>C slave features:
  - Programmable I2C address detection
  - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
  - Standard speed (up to 100 kHz)
  - Fast speed (up to 400 kHz)

## 5 Pinout and pin description

**Table 4. Legend/abbreviations for pin description tables**

|                                       |                                                                                                                                                                                                       |                                                            |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Type</b>                           | I= Input, O = Output, S = Power supply                                                                                                                                                                |                                                            |
| <b>Level</b>                          | Input                                                                                                                                                                                                 | CM = CMOS                                                  |
|                                       | Output                                                                                                                                                                                                | HS = High sink                                             |

1. A pull-up is applied to PF4 during the reset phase. This pin is input floating after reset release.
2. AIN12 is not selectable in ADC scan mode or with analog watchdog.
3. In 44-pin package, AIN9 cannot be used by ADC scan mode.
4. In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to V<sub>DD</sub> are not implemented).
5. The PD1 pin is in input pull-up during the reset phase and after internal reset release.

## 5.1 Alternate function remapping

As shown in the rightmost column of the pin description table, some alternate functions can be remapped at different I/O ports by programming one of eight AFR (alternate function remap) option bits. When the remapping option is active, the default alternate function is no longer available.

To use an alternate function, the corresponding peripheral must be enabled in the peripheral registers.

Alternate function remapping does not effect GPIO capabilities of the I/O ports (see the GPIO section of the family reference manual, RM0016).

6 Memory and register map

6.1 Memory map

Figure 7. Memory map

The following table lists the boundary addresses for each memory size. The top of the stack is at the RAM end address in each case.

Table 6. Flash, data EEPROM and RAM boundary address

| Memory area          | Size (byte) | Start address | End address |
|----------------------|-------------|---------------|-------------|
| Flash program memory | 32 K        | 0x00 8000     | 0x00 FFFF   |
|                      | 16 K        | 0x00 8000     | 0x00 BFFF   |
| RAM                  | 2 K         | 0x00 0000     | 0x00 07FF   |
| Data EEPROM          | 1024        | 0x00 4000     | 0x00 43FF   |

## 6.2 Register map

### 6.2.1 I/O port hardware register map

Table 7. I/O port hardware register map

| Address   | Block  | Register label | Register name                     | Reset status        |
|-----------|--------|----------------|-----------------------------------|---------------------|

1. Except PA1.

## 8 Option byte

Option byte contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Except for the ROP (read-out protection) byte, each option byte has to be stored twice, in a regular form (OPTx) and a complemented one (NOPTx) for redundancy.

Option byte can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in the table below.

Option byte can also be modified 'on the fly' by the application in IAP mode, except the ROP option that can only be modified in ICP mode (via SWIM).

Refer to the STM8S Flash programming manual (PM0051) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

1. Do not use more than one remapping option in the same port.

2. Refer to STM8S105x4/6 pin descriptions.

## 9 Unique ID

The devices feature a 96-bit unique device identifier which provides a reference number that is unique for any device and in any context. The 96 bits of the identifier can never be altered by the user.

The unique device identifier can be read in single byte and may then be concatenated using a custom algorithm.

The unique device identifier is ideally suited:

- For use as serial numbers
- For use as security keys to increase the code security in the program memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal memory.
- To activate secure boot processes

**Table 14. Unique ID registers (96 bits)**

| Address | Content description        | Unique ID bits |   |   |   |   |   |   |   |
|---------|----------------------------|----------------|---|---|---|---|---|---|---|
|         |                            | 7              | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

## 10 Electrical characteristics

### 10.1 Parameter conditions

Unless otherwise specified, all voltages are referred to  $V_{SS}$ .

#### 10.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^{\circ}\text{C}$ , and  $T_A = T_{Amax}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

#### 10.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 5.0\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

#### 10.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 10.1.4 Typical current consumption

For typical current consumption measurements,  $V_{DD}$ ,  $V_{DDIO}$  and  $V_{DDA}$  are connected together in the configuration shown in the following figure.

**Figure 8. Supply current measurement conditions**

### 10.1.5 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 9](#).

**Figure 9. Pin loading conditions**

### 10.1.6 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 10](#).

**Figure 10. Pin input voltage**

## 10.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 15. Voltage characteristics**

| Symbol                             | Ratings                                                                           | Min                                                                     | Max                   | Unit |
|------------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------|-----------------------|------|
| V <sub>DDx</sub> - V <sub>SS</sub> | Supply voltage (including V <sub>DDA</sub> and V <sub>DDIO</sub> ) <sup>(1)</sup> | -0.3                                                                    | 6.5                   | V    |
| V <sub>IN</sub>                    | Input voltage on true open drain pins (PE1, PE2) <sup>(2)</sup>                   | V <sub>SS</sub> - 0.3                                                   | 6.5                   | V    |
|                                    | Input voltage on any other pin <sup>(2)</sup>                                     | V <sub>SS</sub> - 0.3                                                   | V <sub>DD</sub> + 0.3 |      |
| V <sub>DDx</sub> - V <sub>DD</sub> | Variations between different power pins                                           | -                                                                       | 50                    | mV   |
| V <sub>SSx</sub> - V <sub>SS</sub> | Variations between all the different ground pins                                  | -                                                                       | 50                    |      |
| V <sub>ESD</sub>                   | Electrostatic discharge voltage                                                   | see <i>Absolute maximum ratings (electrical sensitivity) on page 89</i> |                       |      |

1. All power ( $V_{DD}$ ) and ground ( $V_{SS}$ ) pins must always be connected to the external power supply
2.  $I_{INJ(PIN)}$  must never be exceeded. This is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{INJ(PIN)}$  value. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ . For true open-drain pads, there is no positive injection current, and the corresponding  $V_{IN}$  maximum must always be respected

**Table 16. Current characteristics**

| Symbol                               | Ratings                                                                                                            | Max. <sup>(1)</sup> | Unit |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------|---------------------|------|
| $I_{VDD}$                            | Total current into $V_{DD}$ power lines (source) <sup>(2)</sup>                                                    | 100                 | mA   |
| $I_{VSS}$                            | Total current out of $V_{SS}$ ground lines (sink) <sup>(1)</sup>                                                   | 80                  |      |
| $I_{IO}$                             | Output current sunk by any I/O and control pin                                                                     | 20                  |      |
|                                      | Output current source by any I/Os and control pin                                                                  | -20                 |      |
| $\Sigma I_{IO}$                      | Total output current sourced (sum of all I/O and control pins) for devices with two $V_{DDIO}$ pins <sup>(3)</sup> | 200                 |      |
|                                      | Total output current sourced (sum of all I/O and control pins) for devices with one $V_{DDIO}$ pin <sup>(3)</sup>  | 100                 |      |
|                                      | Total output current sunk (sum of all I/O and control pins) for devices with two $V_{SSIO}$ pins <sup>(3)</sup>    | 160                 |      |
|                                      | Total output current sunk (sum of all I/O and control pins) for devices with one $V_{SSIO}$ pin <sup>(3)</sup>     | 80                  |      |
| $I_{INJ(PIN)}$ <sup>(4) (5)</sup>    | Injected current on NRST pin                                                                                       | ±4                  |      |
|                                      | Injected current on OSCIN pin                                                                                      | ±4                  |      |
|                                      | Injected current on any other pin <sup>(6)</sup>                                                                   | ±4                  |      |
| $\Sigma I_{INJ(PIN)}$ <sup>(4)</sup> | Total injected current (sum of all I/O and control pins) <sup>(6)</sup>                                            | ±20                 |      |

1. Data based on characterization results, not tested in production.
2. All power ( $V_{DD}$ ,  $V_{DDIO}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSIO}$ ,  $V_{SSA}$ ) pins must always be connected to the external supply.

3. I/O pins used simultaneously for high current source/sink must be uniformly spaced around the package between the VDDIO/VSSIO pins.
4.  $I_{INJ(PIN)}$  must never be exceeded. This condition is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{INJ(PIN)}$  value. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ . For true open-drain pads, there is no positive injection current allowed and the corresponding  $V_{IN}$  maximum must always be respected.
5. Negative injection disturbs the analog performance of the device. See note in *Section: TIM2, TIM3 - 16-bit general purpose timers*.
6. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with  $\Sigma I_{INJ(PIN)}$  maximum current injection on four I/O port pins of the device.

Table 17. Thermal characteristics

| Symbol    | Ratings                      | Value      | Unit |
|-----------|------------------------------|------------|------|
| $T_{STG}$ | Storage temperature range    | -65 to 150 | °C   |
| $T_J$     | Maximum junction temperature | 150        |      |

### 10.3 Operating conditions

The device must be used in operating conditions that respect the parameters described in the table below. In addition, full account must be taken of all physical capacitor characteristics and tolerances.

Table 18. General operating conditions

| Symbol            | Parameter                                                                                            | Conditions                                                                                                                              | Min  | Max  | Unit |
|-------------------|------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|------|------|------|
| $f_{CPU}$         | Internal CPU clock frequency                                                                         | -                                                                                                                                       | 0    | 16   | MHz  |
| $V_{DD}/V_{DDIO}$ | Standard operating voltage                                                                           | -                                                                                                                                       | 2.95 | 5.5  | V    |

|                   |                                                                                                      | 32-pin package, with output on eight standard ports and two high sink ports simultaneously <sup>(4)</sup>                               | -    | 360  |      |

Table 18. General operating conditions (continued)

| Symbol | Parameter                                | Conditions                | Min | Max | Unit |
|--------|------------------------------------------|---------------------------|-----|-----|------|
| $T_A$  | Ambient temperature for suffix 6 version | Maximum power dissipation | -40 | 85  | °C   |
| $T_A$  | Ambient temperature for suffix 3 version | Maximum power dissipation | -40 | 125 |      |
| $T_J$  | Junction temperature range               | Suffix 6 version          | -40 | 105 |      |
|        |                                          | Suffix 3 version          | -40 | 130 |      |

1. Care should be taken when selecting the capacitor, due to its tolerance, as well as the parameter dependency on temperature, DC bias and frequency in addition to other factors. The parameter maximum value must be respected for the full application range.
2. This frequency of 1 MHz as a condition for  $V_{CAP}$  parameters is given by design of internal regulator.
3. To calculate  $P_{Dmax}(T_A)$ , use the formula  $P_{Dmax} = (T_{Jmax} - T_A) / \Theta_{JA}$  (see [Section 12: Thermal characteristics](#)) with the value for  $T_{Jmax}$  given in the previous table and the value for  $\Theta_{JA}$  given in [Section 12: Thermal characteristics](#).
4. See [Section 12: Thermal characteristics](#).

Figure 11.  $f_{CPUmax}$  versus  $V_{DD}$ 

Table 19. Operating conditions at power-up/power-down

| Symbol     | Parameter               | Conditions      | Min              | Typ | Max                | Unit      |
|------------|-------------------------|-----------------|------------------|-----|--------------------|-----------|
| $t_{VDD}$  | $V_{DD}$ rise time rate | -               | 2 <sup>(1)</sup> | -   | $\infty$           | $\mu s/V$ |
|            | $V_{DD}$ fall time rate | -               | 2 <sup>(1)</sup> | -   | $\infty$           |           |
| $t_{TEMP}$ | Reset release delay     | $V_{DD}$ rising | -                | -   | 1.7 <sup>(1)</sup> | ms        |

Table 19. Operating conditions at power-up/power-down (continued)

| Symbol         | Parameter                  | Conditions | Min  | Typ  | Max  | Unit |
|----------------|----------------------------|------------|------|------|------|------|

| $V_{IT-}$      | Brown-out reset threshold  | -          | 2.58 | 2.65 | 2.88 |      |
| $V_{HYS(BOR)}$ | Brown-out reset hysteresis | -          | -    | 70   | -    | mV   |

1. Guaranteed by design, not tested in production.

### 10.3.1 VCAP external capacitor

The stabilization for the main regulator is achieved by connecting an external capacitor  $C_{EXT}$  to the  $V_{CAP}$  pin.  $C_{EXT}$  is specified in [Table 18](#). Care should be taken to limit the series inductance to less than 15 nH.

Figure 12. External capacitor  $C_{EXT}$

1. ESR is the equivalent series resistance and ESL is the equivalent inductance.

### 10.3.2 Supply current characteristics

The current consumption is measured as illustrated in [Figure 10: Pin input voltage](#).

#### Total current consumption in run mode

Table 20. Total current consumption with code execution in run mode at  $V_{DD} = 5\text{ V}$

| Symbol        | Parameter                                            | Conditions                                       |                                       | Typ  | Max <sup>(1)</sup> | Unit |
|---------------|------------------------------------------------------|--------------------------------------------------|---------------------------------------|------|--------------------|------|

1. Data based on characterization results, not tested in production.

2. Configured by the REGAH bit in the CLK\_ICR register.

3. Configured by the AHALT bit in the FLASH\_CR1 register.

### Total current consumption in halt mode

Table 26. Total current consumption in halt mode at  $V_{DD} = 5\text{ V}$ 

| Symbol      | Parameter                   | Conditions                                       | Typ | Max at 85 °C <sup>(1)</sup> | Max at 85 °C <sup>(1)</sup> | Unit          |
|-------------|-----------------------------|--------------------------------------------------|-----|-----------------------------|-----------------------------|---------------|
| $I_{DD(H)}$ | Supply current in halt mode | Flash in operating mode, HSI clock after wakeup  | 62  | 90                          | 150                         | $\mu\text{A}$ |
|             |                             | Flash in power-down mode, HSI clock after wakeup | 6.5 | 25                          | 80                          |               |

1. Data based on characterization results, not tested in production.

Table 27. Total current consumption in halt mode at  $V_{DD} = 3.3\text{ V}$ 

| Symbol      | Parameter                   | Conditions                                       | Typ | Max at 85 °C <sup>(1)</sup> | Max at 85 °C <sup>(1)</sup> | Unit          |
|-------------|-----------------------------|--------------------------------------------------|-----|-----------------------------|-----------------------------|---------------|
| $I_{DD(H)}$ | Supply current in halt mode | Flash in operating mode, HSI clock after wakeup  | 60  | 90                          | 150                         | $\mu\text{A}$ |
|             |                             | Flash in power-down mode, HSI clock after wakeup | 4.5 | 20                          | 80                          |               |

1. Data based on characterization results, not tested in production.

## Low power mode wakeup times

Table 28. Wakeup times

| Symbol        | Parameter                                               | Conditions                               |                                         |                    | Typ               | Max <sup>(1)</sup>      | Unit |
|---------------|---------------------------------------------------------|------------------------------------------|-----------------------------------------|--------------------|-------------------|-------------------------|------|
| $t_{WU(WFI)}$ | Wakeup time from wait mode to run mode <sup>(2)</sup>   | 0 to 16 MHz                              |                                         |                    | -                 | See note <sup>(3)</sup> | μs   |
| $t_{WU(WFI)}$ | Wakeup time from run mode <sup>(2)</sup>                | $f_{CPU} = f_{MASTER} = 16$ MHz          |                                         |                    | 0.56              | -                       |      |
| $t_{WU(AH)}$  | Wakeup time active halt mode to run mode <sup>(2)</sup> | MVR voltage regulator on <sup>(4)</sup>  | Flash in operating mode <sup>(5)</sup>  | HSI (after wakeup) | 1 <sup>(6)</sup>  | 2 <sup>(6)</sup>        |      |
| $t_{WU(AH)}$  | Wakeup time active halt mode to run mode <sup>(2)</sup> | MVR voltage regulator off <sup>(4)</sup> | Flash in operating mode <sup>(5)</sup>  | HSI (after wakeup) | 3 <sup>(6)</sup>  | -                       |      |
| $t_{WU(AH)}$  | Wakeup time active halt mode to run mode <sup>(2)</sup> | MVR voltage regulator off <sup>(4)</sup> | Flash in operating mode <sup>(5)</sup>  | HSI (after wakeup) | 48 <sup>(6)</sup> | -                       |      |
| $t_{WU(AH)}$  | Wakeup time active halt mode to run mode <sup>(2)</sup> | MVR voltage regulator off <sup>(4)</sup> | Flash in power-down mode <sup>(5)</sup> | HSI (after wakeup) | 50 <sup>(6)</sup> | -                       |      |
| $t_{WU(H)}$   | Wakeup time from halt mode to run mode <sup>(2)</sup>   | Flash in operating mode <sup>(5)</sup>   |                                         |                    | 52                | -                       |      |
| $t_{WU(H)}$   | Wakeup time from halt mode to run mode <sup>(2)</sup>   | Flash in power-down mode <sup>(5)</sup>  |                                         |                    | 54                | -                       |      |

1. Data based on characterization results, not tested in production.

2. Measured from interrupt event to interrupt vector fetch

3.  $t_{WU(WFI)} = 2 \times 1/f_{master} + 67 \times 1/f_{CPU}$

4. Configured by the REGAH bit in the CLK\_ICR register.

5. Configured by the AHALT bit in the FLASH\_CR1 register.

6. Plus 1 LSI clock depending on synchronization.

## Total current consumption and timing in forced reset state

Table 29. Total current consumption and timing in forced reset state

| Symbol        | Parameter                                    | Conditions       | Typ | Max <sup>(1)</sup> | Unit |
|---------------|----------------------------------------------|------------------|-----|--------------------|------|
| $I_{DD(R)}$   | Supply current in reset state <sup>(2)</sup> | $V_{DD} = 5$ V   | 500 | -                  | μA   |
|               |                                              | $V_{DD} = 3.3$ V | 400 | -                  |      |
| $t_{RESETBL}$ | Reset pin release to vector fetch            | -                | -   | 150                | μs   |

1. Data guaranteed by design, not tested in production.

2. Characterized with all I/Os tied to  $V_{SS}$ .

## Current consumption of on-chip peripherals

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

HSI internal RC/ $f_{\text{CPU}} = f_{\text{MASTER}} = 16 \text{ MHz}$ ,  $V_{\text{DD}} = 5 \text{ V}$

**Table 30. Peripheral current consumption**

| Symbol                 | Parameter                                          | Typ | Unit          |
|------------------------|----------------------------------------------------|-----|---------------|

1. Data based on a differential  $I_{\text{DD}}$  measurement between reset configuration and timer counter running at 16 MHz. No IC/OC programmed (no I/O pads toggling). Not tested in production.
2. Data based on a differential  $I_{\text{DD}}$  measurement between the on-chip peripheral when kept under reset and not clocked and the on-chip peripheral when clocked and not kept under reset. No I/O pads toggling. Not tested in production.
3. Data based on a differential  $I_{\text{DD}}$  measurement between reset configuration and continuous A/D conversions. Not tested in production.

### Current consumption curves

The following figures show typical current consumption measured with code executing in RAM.

**Figure 13. Typ  $I_{\text{DD(RUN)}}$  vs.  $V_{\text{DD}}$  HSE user external clock,  $f_{\text{CPU}} = 16 \text{ MHz}$**

Figure 14. Typ  $I_{DD(RUN)}$  vs.  $f_{CPU}$  HSE user external clock,  $V_{DD} = 5$  VFigure 15. Typ  $I_{DD(RUN)}$  vs.  $V_{DD}$  HSI RC osc,  $f_{CPU} = 16$  MHz

Figure 16. Typ  $I_{DD(WFI)}$  vs.  $V_{DD}$  HSE external clock,  $f_{CPU} = 16\text{ MHz}$

Figure 17. Typ  $I_{DD(WFI)}$  vs.  $f_{CPU}$  HSE external clock,  $V_{DD} = 5\text{ V}$

Figure 18. Typ  $I_{DD(WFI)}$  vs.  $V_{DD}$  HSI RC osc.,  $f_{CPU} = 16$  MHz

### 10.3.3 External clock sources and timing characteristics

#### HSE user external clock

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

**Table 31. HSE user external clock characteristics**

| Symbol           | Parameter                            | Conditions                 | Min                 | Max                      | Unit          |
|------------------|--------------------------------------|----------------------------|---------------------|--------------------------|---------------|
| $f_{HSE\_ext}$   | User external clock source frequency | -                          | 0                   | 16                       | MHz           |
| $V_{HSEH}^{(1)}$ | OSCIN input pin high level voltage   | -                          | $0.7 \times V_{DD}$ | $V_{DD} + 0.3 \text{ V}$ | V             |
| $V_{HSEL}^{(1)}$ | OSCIN input pin low level voltage    | -                          | $V_{SS}$            | $0.3 \times V_{DD}$      |               |
| $I_{LEAK\_HSE}$  | OSCIN input leakage current          | $V_{SS} < V_{IN} < V_{DD}$ | -1                  | +1                       | $\mu\text{A}$ |

1. Data based on characterization results, not tested in production.

**Figure 19. HSE external clock source**

**HSE crystal/ceramic resonator oscillator**

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

**Table 32. HSE oscillator characteristics**

| Symbol              | Parameter                                   | Conditions                      | Min | Typ | Max                                             | Unit       |
|---------------------|---------------------------------------------|---------------------------------|-----|-----|-------------------------------------------------|------------|
| $f_{HSE}$           | External high speed oscillator frequency    | -                               | 1   | -   | 16                                              | MHz        |
| $R_F$               | Feedback resistor                           | -                               | -   | 220 | -                                               | k $\Omega$ |
| $C^{(1)}$           | Recommended load capacitance <sup>(2)</sup> | -                               | -   | -   | 20                                              | pF         |
| $I_{DD(HSE)}$       | HSE oscillator power consumption            | C = 20 pF<br>$f_{OSC} = 16$ MHz | -   | -   | 6 (start up)<br>1.6 (stabilized) <sup>(3)</sup> | mA         |
|                     |                                             | C = 10 pF<br>$f_{OSC} = 16$ MHz | -   | -   | 6 (start up)<br>1.2 (stabilized) <sup>(3)</sup> |            |
| $g_m$               | Oscillator transconductance                 | -                               | 5   | -   | -                                               | mA/V       |
| $t_{SU(HSE)}^{(4)}$ | Startup time                                | $V_{DD}$ is stabilized          | -   | 1   | -                                               | ms         |

1. C is approximately equivalent to 2 x crystal Cload.
2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small Rm value. Refer to crystal manufacturer for more details
3. Data based on characterization results, not tested in production.
4.  $t_{SU(HSE)}$  is the start-up time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 20. HSE oscillator circuit diagram

**HSE oscillator critical  $g_m$  equation**

$$g_{m\text{crit}} = (2 \times \Pi \times f_{\text{HSE}})^2 \times R_m (2C_o + C)^2$$

$R_m$ : Notional resistance (see crystal specification)

$L_m$ : Notional inductance (see crystal specification)

$C_m$ : Notional capacitance (see crystal specification)

$C_o$ : Shunt capacitance (see crystal specification)

$C_{L1} = C_{L2} = C$ : Grounded external capacitance

$g_m \gg g_{m\text{crit}}$

### 10.3.4 Internal clock sources and timing characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

#### High speed internal RC oscillator (HSI)

Table 33. HSI oscillator characteristics

| Symbol        | Parameter                                        | Conditions                                                                                     | Min                 | Typ | Max                | Unit          |

| $I_{DD(LSI)}$ | LSI oscillator power consumption | -          | -   | 5   | -                | $\mu A$ |

1. Guaranteed by design, not tested in production.

**Figure 23. Typical LSI frequency variation vs  $V_{DD}$  @ 4 temperatures**

### 10.3.5 Memory characteristics

#### RAM and hardware registers

**Table 35. RAM and hardware registers**

| Symbol   | Parameter                          | Conditions           | Min                         | Unit |
|----------|------------------------------------|----------------------|-----------------------------|------|
| $V_{RM}$ | Data retention mode <sup>(1)</sup> | Halt mode (or reset) | $V_{IT-max}$ <sup>(2)</sup> | V    |

1. Minimum supply voltage without losing data stored in RAM (in halt mode or under reset) or in hardware registers (only in halt mode). Guaranteed by design, not tested in production.

2. Refer to [Section 10.3: Operating conditions](#) for the value of  $V_{IT-max}$ .

#### Flash program memory/data EEPROM memory

**Table 36. Flash program memory/data EEPROM memory**

| Symbol      | Parameter                                                                                                   | Conditions                            | Min <sup>(1)</sup> | Typ | Max  | Unit  |
|-------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------|-----|------|-------|
| $V_{DD}$    | Operating voltage<br>(all modes, execution/write/erase)                                                     | $f_{CPU} \leq 16 \text{ MHz}$         | 2.95               | -   | 5.5  | V     |
| $t_{prog}$  | Standard programming time (including erase) for byte/word/block<br>(1 byte/4 byte/128 byte)                 | -                                     | -                  | 6   | 6.6  | ms    |
|             | Fast programming time for 1 block<br>(128 byte)                                                             | -                                     | -                  | 3   | 3.33 |       |
| $t_{erase}$ | Erase time for 1 block (128 byte)                                                                           | -                                     | -                  | 3   | 3.33 |       |
| $N_{RW}$    | Erase/write cycles<br>(program memory) <sup>(2)</sup>                                                       | $T_A = +85 \text{ }^\circ\text{C}$    | 10k                | -   | -    | cycle |
|             | Erase/write cycles (data memory) <sup>(2)</sup>                                                             | $T_A = +125 \text{ }^\circ\text{C}$   | 300k               | 1M  | -    |       |
| $t_{RET}$   | Data retention (program and data memory) after 10k erase/write cycles at $T_A = +55 \text{ }^\circ\text{C}$ | $T_{RET} = 55 \text{ }^\circ\text{C}$ | 20                 | -   | -    | year  |
|             | Data retention (data memory) after 300k erase/write cycles at $T_A = +125 \text{ }^\circ\text{C}$           | $T_{RET} = 85 \text{ }^\circ\text{C}$ | 1                  | -   | -    |       |
| $I_{DD}$    | Supply current (Flash programming or erasing for 1 to 128 byte)                                             | -                                     | -                  | 2   | -    | mA    |

1. Data based on characterization results, not tested in production.

2. The physical granularity of the memory is 4 byte, so cycling is performed on 4 byte even when a write/erase operation addresses a single byte.

### 10.3.6 I/O port pin characteristics

#### General characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified. All unused pins must be kept at a fixed voltage, using the output mode of the I/O for example or an external pull-up or pull-down resistor.

**Table 37. I/O static characteristics**

| Symbol               | Parameter                       | Conditions                                  | Min                 | Typ | Max                     | Unit          |
|----------------------|---------------------------------|---------------------------------------------|---------------------|-----|-------------------------|---------------|
| $V_{IL}$             | Input low level voltage         | $V_{DD} = 5\text{ V}$                       | -0.3 V              | -   | $0.3 \times V_{DD}$     | V             |
| $V_{IH}$             | Input high level voltage        |                                             | $0.7 \times V_{DD}$ | -   | $V_{DD} + 0.3\text{ V}$ |               |
| $V_{hys}$            | Hysteresis <sup>(1)</sup>       |                                             | -                   | 700 | -                       | mV            |

| $t_{OP(NRST)}$   | NRST output pulse <sup>(3)</sup>             | -                       | 20                  | -   | -                   | $\mu\text{s}$ |

1. Data based on characterization results, not tested in production.

2. The  $R_{PU}$  pull-up equivalent resistor is based on a resistive transistor.

3. Data guaranteed by design, not tested in production.

**Figure 37. Typical NRST  $V_{IL}$  and  $V_{IH}$  vs  $V_{DD}$  @ 4 temperatures**

Figure 38. Typical NRST pull-up resistance  $R_{PU}$  vs  $V_{DD}$  @ 4 temperaturesFigure 39. Typical NRST pull-up current  $I_{PU}$  vs  $V_{DD}$  @ 4 temperatures

The reset network shown in [Figure 40](#) protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below  $V_{IL(NRST)}$  max (see [Table 41: NRST pin characteristics](#)), otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If NRST signal is used to reset external circuitry, attention must be taken to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. Minimum recommended capacity is 100 nF.

Figure 40. Recommended reset pin protection

10.3.9 SPI serial peripheral interface

Unless otherwise specified, the parameters given in [Table 42](#) are derived from tests performed under ambient temperature,  $f_{\text{MASTER}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions.  $t_{\text{MASTER}} = 1/f_{\text{MASTER}}$ .

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 42. SPI characteristics

| Symbol                                    | Parameter           | Conditions <sup>(1)</sup> | Min | Max | Unit |

- Parameters are given by selecting 10 MHz I/O output frequency.
- Values based on design simulation and/or characterization results, and not tested in production.
- Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
- Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

1.  $f_{MASTER}$  must be at least 8 MHz to achieve max fast I<sup>2</sup>C speed (400 kHz)
2. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL

Figure 44. Typical application with I<sup>2</sup>C bus and timing diagram

### 10.3.11 10-bit ADC characteristics

Subject to general operating conditions for  $V_{DDA}$ ,  $f_{MASTER}$ , and  $T_A$  unless otherwise specified.

**Table 44. ADC characteristics**

| Symbol      | Parameter                                                                  | Conditions                                | Min                 | Typ  | Max                | Unit        |
|-------------|----------------------------------------------------------------------------|-------------------------------------------|---------------------|------|--------------------|-------------|
| $f_{ADC}$   | ADC clock frequency                                                        | $V_{DD} = 2.95$ to $5.5$ V                | 1                   | -    | 4                  | MHz         |
|             |                                                                            | $V_{DD} = 4.5$ to $5.5$ V                 | 1                   | -    | 6                  |             |
| $V_{DDA}$   | Analog supply                                                              | -                                         | 3.0                 | -    | 5.5                | V           |

|             |                                                                            | $f_{ADC} = 6$ MHz                         | 2.33                |      |                    | $\mu s$     |
|             |                                                                            | -                                         | 14                  |      |                    | $1/f_{ADC}$ |

1. Data guaranteed by design, not tested in production.

2. During the sample time, the sampling capacitance,  $C_{AIN}$  (3 pF max), can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within  $t_S$ . After the end of the sample time  $t_S$ , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock  $t_S$  depend on programming.

Table 45. ADC accuracy with  $R_{AIN} < 10\text{ k}\Omega$ ,  $V_{DDA} = 5\text{ V}$ 

| Symbol         | Parameter                                   | Conditions               | Typ | Max <sup>(1)</sup> | Unit |

|                |                                             | f <sub>ADC</sub> = 6 MHz | 0.6 | 1.5                |      |

1. Data based on characterization results, not tested in production.

2. ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for I<sub>INJ(PIN)</sub> and ΣI<sub>INJ(PIN)</sub> in [Section 10.3.6](#) does not affect the ADC accuracy.

Table 46. ADC accuracy with  $R_{AIN} < 10\text{ k}\Omega$ ,  $V_{DDA} = 3.3\text{ V}$

1. Data based on characterization results, not tested in production.

2. ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 10.3.6](#) does not affect the ADC accuracy.

Figure 45. ADC accuracy characteristics

1. Example of an actual transfer curve
  2. The ideal transfer curve
  3. End point correlation line
- $E_T$  = Total unadjusted error: maximum deviation between the actual and the ideal transfer curves.  
 $E_O$  = Offset error: deviation between the first actual transition and the first ideal one.  
 $E_G$  = Gain error: deviation between the last ideal transition and the last actual one.  
 $E_D$  = Differential linearity error: maximum deviation between actual steps and the ideal one.  
 $E_L$  = Integral linearity error: maximum deviation between any actual transition and the end point correlation line.

Figure 46. Typical application with ADC

1. Legend:  $R_{AIN}$  = external resistance,  $C_{AIN}$  = capacitors,  $C_{smp}$  = internal sample and hold capacitor.

### 10.3.12 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

#### Functional EMS (electromagnetic susceptibility)

While executing a simple application (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709 (EMC design guide for STM microcontrollers).

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be recovered by applying a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring. See application note AN1015 (Software techniques for improving microcontroller EMC performance).

Table 47. EMS data

| Symbol     | Parameter                                                                                                                         | Conditions                                                                                                                            | Level/class        |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| $V_{FESD}$ | Voltage limits to be applied on any I/O pin to induce a functional disturbance                                                    | $V_{DD} = 5\text{ V}$ , $T_A = 25\text{ }^{\circ}\text{C}$ ,<br>$f_{MASTER} = 16\text{ MHz}$ (HSI clock),<br>Conforms to IEC 1000-4-2 | 2/B <sup>(1)</sup> |
| $V_{EFTB}$ | Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance | $V_{DD} = 5\text{ V}$ , $T_A = 25\text{ }^{\circ}\text{C}$ ,<br>$f_{MASTER} = 16\text{ MHz}$ (HSI clock),<br>Conforms to IEC 1000-4-4 | 4/A <sup>(1)</sup> |

1. Data obtained with HSI clock configuration, after applying the hardware recommendations described in AN2860 (EMC guidelines for STM8S microcontrollers).

### Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC 61967-2 which specifies the board and the loading of each pin.

**Table 48. EMI data**

1. Data based on characterization results, not tested in production.

### Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD, DLU and LU) using specific measurement methods, the product is stressed to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts x (n+1) supply pin). One model can be simulated: Human body model. This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

**Table 49. ESD absolute maximum ratings**

| Symbol         | Ratings                                               | Conditions                                                     | Class | Maximum value <sup>(1)</sup> | Unit |
|----------------|-------------------------------------------------------|----------------------------------------------------------------|-------|------------------------------|------|
| $V_{ESD(HBM)}$ | Electrostatic discharge voltage (Human body model)    | $T_A = 25\text{ }^{\circ}\text{C}$ , conforming to JESD22-A114 | A     | 2000                         | V    |
| $V_{ESD(CDM)}$ | Electrostatic discharge voltage (Charge device model) | $T_A = 25\text{ }^{\circ}\text{C}$ , conforming to SD22-C101   | IV    | 1000                         |      |

1. Data based on characterization results, not tested in production

### Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance.

- A supply overvoltage (applied to each power supply pin), and
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

**Table 50. Electrical sensitivities**

| Symbol | Parameter             | Conditions            | Class <sup>(1)</sup> |
|--------|-----------------------|-----------------------|----------------------|
| LU     | Static latch-up class | $T_A = 25\text{ °C}$  | A                    |
|        |                       | $T_A = 85\text{ °C}$  |                      |
|        |                       | $T_A = 125\text{ °C}$ |                      |

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

## 11 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

1. Values in inches are converted from mm and rounded to 4 decimal digits.

**Figure 57. UFQFPN32 - 32-pin, 5 x5 mm, 0.5 mm pitch ultra thin fine pitch quad flat package recommended footprint**

1. Dimensions are expressed in millimeters.

### Device marking

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

**Figure 58. UFQFPN32 marking example (package top view)**

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

## 11.5 SDIP32 package information

## Device marking

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Figure 60. SDIP32 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

## 12 Thermal characteristics

The maximum junction temperature ( $T_{Jmax}$ ) of the device must never exceed the values specified in [Table 18: General operating conditions](#), otherwise the functionality of the device cannot be guaranteed.

The maximum junction temperature  $T_{Jmax}$ , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- $T_{Amax}$  is the maximum ambient temperature in °C
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance in °C/W
- $P_{Dmax}$  is the sum of  $P_{INTmax}$  and  $P_{I/Omax}$  ( $P_{Dmax} = P_{INTmax} + P_{I/Omax}$ )
- $P_{INTmax}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$  represents the maximum power dissipation on output pins

Where:

$P_{I/Omax} = \Sigma (V_{OL} \cdot I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \cdot I_{OH})$ ,  
taking into account the actual  $V_{OL}/I_{OL}$  and  $V_{OH}/I_{OH}$  of the I/Os at low and high level in the application.

**Table 56. Thermal characteristics<sup>(1)</sup>**

| Symbol        | Parameter                                                | Value | Unit |
|---------------|----------------------------------------------------------|-------|------|
| $\Theta_{JA}$ | Thermal resistance junction-ambient<br>LQFP48 - 7x7 mm   |       | °C/W |
|               | Thermal resistance junction-ambient<br>LQFP44 - 10x10 mm |       |      |
|               | Thermal resistance junction-ambient<br>LQFP32 - 7x7 mm   |       |      |
|               | Thermal resistance junction-ambient<br>UFQFPN32 - 5x5 mm |       |      |
|               | Thermal resistance junction-ambient<br>SDIP32 - 400 ml   |       |      |

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

### 12.1 Reference document

JESD51-2 integrated circuits thermal test method environment conditions - natural convection (still air). Available from [www.jedec.org](http://www.jedec.org).

## 12.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code (see [Section 13: Ordering information](#)).

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 82^{\circ}\text{C}$  (measured according to JESD51-2),

$I_{DDmax} = 15\text{ mA}$ ,  $V_{DD} = 5.5\text{ V}$

Maximum 8 standard I/Os used at the same time in output at low level with

$I_{OL} = 10\text{ mA}$ ,  $V_{OL} = 2\text{ V}$

Maximum 4 high sink I/Os used at the same time in output at low level with

$I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 1.5\text{ V}$

Maximum 2 true open drain I/Os used at the same time in output at low level with

$I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 2\text{ V}$

$P_{INTmax} = 15\text{ mA} \times 5.5\text{ V} = 82.5\text{ mW}$

$P_{IOmax} = (10\text{ mA} \times 2\text{ V} \times 8) + (20\text{ mA} \times 2\text{ V} \times 2) + (20\text{ mA} \times 1.5\text{ V} \times 4) = 360\text{ mW}$

This gives:  $P_{INTmax} = 82.5\text{ mW}$  and  $P_{IOmax} = 360\text{ mW}$ :

$P_{Dmax} = 82.5\text{ mW} + 360\text{ mW}$

Thus:  $P_{Dmax} = 443\text{ mW}$ .

Using the values obtained in [Table 56: Thermal characteristics](#)  $T_{Jmax}$  is calculated as follows:

For LQFP32  $60^{\circ}\text{C/W}$

$T_{Jmax} = 82^{\circ}\text{C} + (60^{\circ}\text{C/W} \times 443\text{ mW}) = 82^{\circ}\text{C} + 27^{\circ}\text{C} = 109^{\circ}\text{C}$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 131^{\circ}\text{C}$ ).

Parts must be ordered at least with the temperature range suffix 3.

## 13 Ordering information

Figure 61. STM8S105x4/6 access line ordering information scheme<sup>(1)</sup>

1. A dedicated ordering information scheme will be released if, in the future, memory programming service (FastROM) is required. The letter "P" will be added after STM8S. Three unique letters identifying the customer application code will also be visible in the codification. Example: STM8SP103K3MACTR.

For a list of available options (for example memory size, package) and orderable part numbers or for further information on any aspect of this device, please go to [www.st.com](http://www.st.com) or contact the nearest ST Sales Office.

## 13.1 STM8S105 FASTROM microcontroller option list

(last update: September 2010)

|                                       |       |
|---------------------------------------|-------|
| Customer                              | ..... |
| Address                               | ..... |
| Contact                               | ..... |
| Phone number                          | ..... |
| FASTROM code reference <sup>(1)</sup> | ..... |

1. The FASTROM code name is assigned by STMicroelectronics.

The preferable format for programing code is .Hex (.s19 is accepted)

If data EEPROM programing is required, a separate file must be sent with the requested data.

*Note:* See the option byte section in the datasheet for authorized option byte combinations and a detailed explanation.

### Device type/memory size/package (check only one option)

| FASTROM device | 16 Kbyte                            | 32 Kbyte                            |

## 14 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STice emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

### 14.1 Emulation and in-circuit debugging tools

The STice emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STice offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet your development requirements and to adapt your emulation system to support existing and future ST microcontrollers.

#### 14.1.1 STice key features

- Occurrence and time profiling and code coverage (new features),
- Advanced breakpoints with up to 4 levels of conditions,
- Data breakpoints,
- Program and data trace recording up to 128 KB records,
- Read/write on the fly of memory during emulation,
- In-circuit debugging/programming via SWIM protocol,
- 8-bit probe analyzer,
- 1 input and 2 output triggers,
- Power supply follower managing application voltages between 1.62 to 5.5 V,
- Modularity that allows you to specify the components you need to meet your development requirements and adapt to future requirements.
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

## 14.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST Visual Develop (STVD) IDE and the ST Visual Programmer (STVP) software interface. STVD provides seamless integration of the Cosmic and Raisonance C compilers for STM8, which are available in a free version that outputs up to 16 Kbytes of code.

### 14.2.1 STM8 toolset

The STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at [www.st.com](http://www.st.com). This package includes:

#### ST visual develop

Full-featured integrated development environment from STMicroelectronics, featuring:

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STice such as code profiling and coverage

#### ST visual programmer (STVP)

Easy-to-use, unlimited graphical interface allowing read, write and verification of the STM8 Flash program memory, data EEPROM and option bytes. STVP also offers project mode for the saving of programming configurations and the automation of programming sequences.

### 14.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of user applications directly from an easy-to-use graphical interface.

Available toolchains include:

#### C compiler for STM8

Available in a free version that outputs up to 16 Kbytes of code. For more information, see [www.cosmic-software.com](http://www.cosmic-software.com).

#### STM8 assembler linker

Free assembly toolchain included in the STVD toolset, used to assemble and link the user application source code.

## 14.3 Programming tools

During the development cycle, STice provides in-circuit programming of the STM8 Flash microcontroller on the application board via the SWIM protocol. Additional tools include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for the STM8 programming.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.

| 21-Sep-2010 | 10       | <p><i>Table: Legend/Abbreviations for pinout tables:</i> updated "reset state"; removed "HS", (T), and "[ ]".</p> <p><i>Section: Pin description for STM8S105 microcontrollers:</i> added footnotes to the PF4 and PD1 pins.</p> <p><i>Table: I/O port hardware register map:</i> changed reset status of Px_IDR from 0x00 to 0xFF.</p> <p><i>Table: General hardware register map:</i> Standardized all address and reset state values; updated the reset state values of the RST_SR, CLK_SWCR, CLK_HSITRMR, CLK_SWIMCCR, IWDG_KR, UART2_DR, and ADC_DRx registers; replaced reserved address "0x00 5248" with the UART2_CR5.</p> <p><i>Section: Recommended reset pin protection:</i> replaced 0.01 <math>\mu</math>F with 0.1 <math>\mu</math>F</p> <p>Updated <i>Figure: Typical application with I2C bus and timing diagram.</i></p> <p>Updated <i>Table: ADC accuracy with RAIN &lt; 10 kohm</i>, VDDA = 5 V footnote 1 in and <i>Table: ADC accuracy with RAIN &lt; 10 kohm RAIN</i>, VDDA = 3.3 V.</p> <p><i>Section: STM8S105 FASTROM microcontroller option list:</i> removed bits 6 and 7 from OPT1 user boot code area (UBC); added "disable" to 00h and "enable" to 55h of OPTBL bootloader option byte.</p> <p><i>Section: VFQFPN Package Mechanical data:</i> replaced note 1 and added note 2.</p> |
| 04-Apr-2012 | 11       | <p>Removed VFQFPN32 package.</p> <p>Modified <i>Section: Description.</i></p> <p>Remove weak pull-up input for PE1 and PE2 in <i>Table: Pin description for STM8S105 microcontrollers</i></p> <p>Updated <i>Table: Interrupt mapping</i> for TIM2 and TIM4.</p> <p>Updated notes related to VCAP in xm-replace_text</p> <p>General operating conditions.</p> <p>Added values of <math>t_R/t_F</math> for 50 pF load capacitance, and updated note in <i>Section: I/O static characteristics.</i></p> <p>Updated typical and maximum values of RPU in <i>Table: I/O static characteristics</i> and <i>Table: RST pin characteristics.</i></p> <p>Changed SCK input to SCK output in <i>Table: SPI serial peripheral interface.</i></p> <p>Added <math>\Theta_{JA}</math> for UFQFPN32 and SDIP32 in <i>Table: Thermal characteristics</i>, and updated <i>Section: Selecting the product temperature range</i></p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| 28-Jun-2012 | 12       | <p>Added UFQFPN package thickness in <i>Figure: STM8S105xx access line ordering information scheme</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 57. Document revision history (continued)

| Date        | Revision | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
