TEST CIRCUITS
Notes: Close S3 for positive gain. Input signal to RF(+Av) connector.
The gain $Av = 1 + R_{FB}/R_{IN}$.
For unity gain, remove R_{IN} and short R_{FB}.
Open S3 for negative gain. Input signal to RF(-Av) connector.
The gain $Av = -R_{FB}/R_{IN}$.
S1 and S2 are switches for possible resistor and capacitor load connections.

APPLICATION INFORMATION

Power Supply Bypassing
Regular supply bypassing techniques are recommended. A 10µF capacitor in parallel with a 0.1µF capacitor on both the positive and negative supplies is ideal. For the best performance, all bypassing capacitors should

be located as close to the op amp as possible and all capacitors should be low ESL (Equivalent Series Inductance) and low ESR (Equivalent Series Resistance). Surface mount ceramic capacitors are ideal.
TYPICAL APPLICATION CIRCUIT
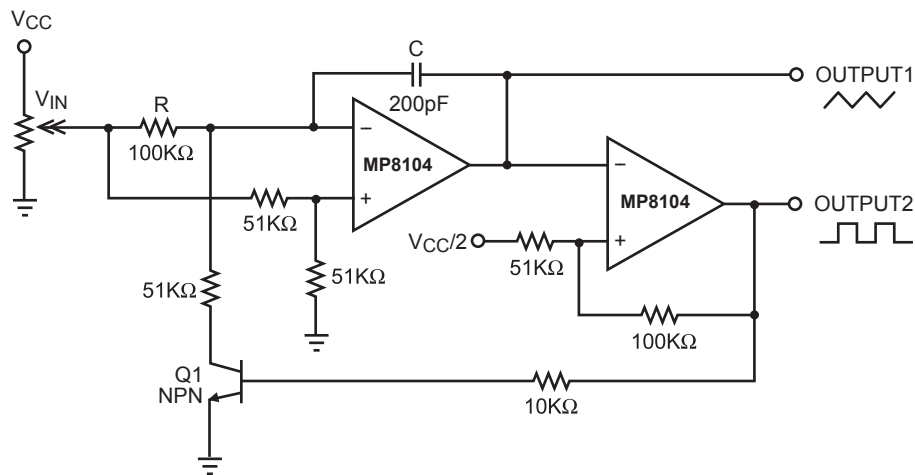

Notes:
1) The control voltage V_{IN} is wide, $0 < V_{IN} < V_{CC} - 1V$
2) The switch frequency can be changed by adjusting R and C.
