PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the signal to be buffered. These inputs accept AC or DC-coupled signals as small as 100mV. Each pin of this pair internally terminates to a VT pin through 50Ω. Note that this input will default to an indeterminate state if left open. Please refer to the "Input Interface Applications" section for more details.
2	VT	Input Termination Center-Tap: Each side of the differential input pair terminates to this pin. The VT pin provides a center-tap to a termination network for maximum interface flexibility. See "Input Interface Applications" section for more details.
3	VREF-AC	Reference Output Voltage: This output biases to $V_{CC} - 1.2\text{V}$. Connect to VT pin when AC-coupling the input. Bypass with 0.01μF low ESR capacitor to V_{CC} . Maximum current source or sink is 0.5mA. See "Input Interface Applications" section.
8	VCC	Positive Power Supply. Bypass with 0.1μF 0.01μF low ESR capacitors as close to the VCC pin as possible.
7, 6	Q, /Q	Differential 100K LVPECL Output: This LVPECL output is the output of the device. Terminate through 50Ω to $V_{CC} - 3.0\text{V}$. See "Output Interface Applications" section.
5	GND, Exposed	Ground. Ground pin and exposed pad must be connected to the same ground plane.

Notes:

1. Permanent device damage may occur if the ratings in "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied for conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Due to the limited drive capability use for input of the same package only.
4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB. ψ_{JB} uses 4-layer θ_{JA} in still-air, unless otherwise stated.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. Includes current through internal 50 Ω pull-ups.
7. V_{IH} (min) not lower than 1.2V.

Notes:

8. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
9. High-frequency AC electricals are guaranteed by design and characterization.
10. Random jitter is measured with a K28.7 comma detect character pattern, measured at 2.5Gbps/3.2Gbps.
11. Deterministic jitter is measured at 2.5Gbps/3.2Gbps with both K28.5 and 2²³-1 PRBS pattern.
12. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.
13. Total jitter definition: with an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10¹² output edges will deviate by more than the specified peak-to-peak jitter value.
