UltraScale and UltraScale+ FPGAs Packaging and Pinouts

Product Specification

UG575 (v1.14) March 18, 2020

XILINX

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
3/18/2020	1.14	Updated Table 2-1, Table 3-4, and Table 4-1 XCVU19P (FSVA3824 and FSVB3824 packages) to production. Chapter 5: Updated definitions in Table 5-1 for when the bar code contains the mark information. Updated Figure 5-1, Figure 5-2, Figure 5-3, and Figure 5-4 with the updated mark images. Chapter 7: Added the Typical Conditions for IR Reflow Soldering of Ceramic Column Grid Array Packages section. Updated the Pb-Free Reflow Soldering section including adding Table 7-2 and Table 7-3, changes to Table 7-4 (mass reflow), heating rate recommendations, and other discussions including adding photos of thermocouples. Updated the Conformal Coating recommendation. Added a Strain Gauge Measurement section, moved and updated the Solder Paste section, and added the Component Placement section. Chapter 8: Updated the BGA Packages section, added the Stencil section, and moved the Solder Paste section. Chapter 9: Added the Component Clearance Surrounding Edge Bond section and updated the Edge Bond Removal section. Chapter 11: Updated the Applied Pressure from Heat Sink to the Package via Thermal Interface Materials section.
9/27/2019	1.13	Added XCVU19P (FSVA3824 and FSVB3824 packages). Added the XCVU45P (FSVH2104 and FSVH2892) and XCVU47P (FSVH2892) devices/package combinations to appropriate tables and chapters. Chapter 1: Added Table 1-8: I/O Bank Migration for VU19P devices: HP I/O Banks are Unshaded and HD I/O Banks are in Dark Gray. Updated Figure 1-114 GTY Quad power supply designations on the right side. Chapter 3: Updated Figure 3-151, Figure 3-152, Figure 3-153, and Figure 3-154. Chapter 7: Revised the maximum peak temperature range from 240°C–250°C to 245°C–250°C. Chapter 8: Updated discussions, added the Bull's Eye Stencil Recommendation section with Figure 8-3 and the Solder Paste section. Chapter 9: Added chapter.

Date	Version	Revision
3/20/2019	1.12	Chapter 1: Added an Important note about XQ devices with eutectic BGA balls on page 18. Added the XQKU5P (FFRB676, SFRB784), XQKU15P (FFRA1156, FFRE1517), XQVU3P (FFRC1517), XQVU7P (FLRA2104, FLRB2104), and XQVU11P (FLRC2104) device/package combinations to Table 1-1, Table 1-2, Table 1-4, Table 1-6, Table 1-7, Table 1-9, Table 1-9, and the appropriate figures in the Device Diagrams section. In Table 1-5, corrected D*[04 to 31]* configuration data pins label and added note to VCCAUX_IO. Revised the XCVU31P Bank Diagrams, XCVU33P Bank Diagrams, XCVU35P and XCVU45P Bank Diagrams, XCVU37P and XCVU47P Bank Diagrams and to show the correct PCIE4 and PCIE4C banks.Added the XCVU27P (FIGD2104, FSGA2577) and XCVU29P (FIGD2104, FSGA2577) devices. This includes adding Table 1-3 and updates to Table 1-1, Table 1-4, Table 1-5, Table 1-6, Table 1-7, Table 1-9, and the appropriate figures in the Device Diagrams section. Updated the XCVU27P Bank Diagrams. Chapter 2: Added an Important note about XQ devices with eutectic BGA balls on page 176. In Table 2-1, added the XCVU27P (FIGD2104, FSGA2577) and XCVU29P (FIGD2104, FSGA2577) devices and the XQKU5P (FFRB676, SFRB784), XQKU15P (FFRA1156, FFRE1517), XQVU3P (FFRC1517), XQVU7P (FLRA2104, FLRB2104), and XQVU11P (FLRC2104) device/package combinations. Chapter 3: Added an Important note about XQ devices with eutectic BGA balls on page 180. In Table 3-3, added the XQKU5P (FFRB676, SFRB784), XQKU15P (FFRA1156, FFRE1517) device/package combinations. In Table 3-4, added the XCVU27P (FIGD2104, FSGA2577), XCVU29P (FIGD2104, FSGA2577), XQVU3P (FFRC1517), XQVU7P (FLRA2104, FLRB2104), and XQVU11P (FLRC2104) device/package combinations. Chapter 4: Added to the Summary information on XQ devices with eutectic BGA balls and updated Table 4-1 with the packages specific to the XQ versions. In Table 4-1, added the mechanical drawings for the XQKU5P (FFRB676, SFRB784), XQKU15P (FFRA1156, FFRE1517), XQVU3P (FFRC1517), XQVU7P (FLRA2104, FLRB2104), and XQVU11P (FLRC2104), and updated the FIGD2104 and FSGA2577 drawings to add the XCVU27P and XCVU29P. Chapter 5: Added Figure 5-5 and updated Table 5-1. Chapter 6: Updated Table 6-1 with the FSGA2577 package and the XQ packages (FFRB676, SFRB784, FFRA1156, FFRC1517, FFRE1517, FLRA2104, FLRB2104, FLRC2104). Added an Important note about XQ devices with eutectic BGA balls on page 418. Chapter 7: Updated the Sn/Pb reflow soldering guidelines including changes to Figure 7-3. Added the FSGA2577 package and the XQ packages (FFRB676, SFRB784, FFRA1156, FFRC1517, FFRE1517, FLRA2104, FLRB2104, FLRC2104) to Table 7-4 and added Note 2. Updated the Conformal Coating section. Chapter 10: Added an Important note about XQ devices with eutectic BGA balls on page 438. Updated Table 10-1 with new data. Although the same information was already in Note 2 at the end of Table 10-1, it is repeated in an additional Important note on page 437. Added an Important note about XQ devices with eutectic BGA balls on page 438. In Table 10-1, revised FFVE900 values, added the XCVU27P (FIGD2104, FSGA2577), XCVU29P (FIGD2104, FSGA2577), XQKU5P (FFRB676, SFRB784), XQKU15P (FFRA1156, FFRE1517), XQVU3P (FFRC1517), XQVU7P (FLRA2104, FLRB2104), and XQVU11P (FLRC2104) device/package data. Also added data to the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices. Chapter 11: Updated applied pressure range in Recommended note on page 449 to 20–50 psi.

Date	Version	Revision
8/23/2018	1.11	Chapter 1: In Table 1-5, updated the GC or HDGC direction to Input/Output. In Table 1-9, updated the XCVU160-FLGB2104 map to change the 233 quad location and added the 233 and 133 quads to XCVU160-FLGC2104 map. Chapter 2: In Table 2-1, updated the XCVU31P-FSVH1924, XCVU33P/XCVU35P-FSVH2104, XCVU13P-FSGA2577, and XCVU35P/XCVU37P-FSVH2892 to production and revised the links. Chapter 3: In Table 3-4, updated the XCVU31P-FSVH1924, XCVU33P/XCVU35P-FSVH2104, XCVU13P-FSGA2577, and XCVU35P/XCVU37P-FSVH2892 to production. Chapter 4: In Table 4-1, updated the mechanical drawing status for XCVU31P-FSVH1924, XCVU33P/XCVU35P-FSVH2104, XCVU13P-FSGA2577, and XCVU35P/XCVU37P-FSVH2892 to production. Chapter 10: In Table 10-1, added the XCVU31P-FSVH1924, XCVU33P/XCVU35P-FSVH2104, XCVU13P-FSGA2577, and XCVU35P/XCVU37P-FSVH2892 devices.
4/09/2018	1.10	Chapter 1: Updated the Bank Locations of Dedicated and Multi-Function Pins section. Added the XCVU13P-FSGA2577 device/package combination and the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices. This includes updates to Table 1-1, Table 1-2, Table 1-4, Table 1-5, Table 1-6, Table 1-7, and Table 1-9. Added Figure 1-125, Figure 1-126, Figure 1-127, Figure 1-128, Figure 1-129, Figure 1-130, Figure 1-131, Figure 1-132, and Figure 1-133. Chapter 2: Added the XCVU13P-FSGA2577 device/package combination and the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices to Table 2-1. Chapter 3: Added the XCVU13P-FSGA2577 device/package combination and the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices to Table 3-4. Chapter 4: Added the XCVU13P-FSGA2577 device/package combination and the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices to Table 4-1. Chapter 6: Added the FSVH1924, FSVH2104, FSGA2577, and FSVH2892 packages to Table 6-1. Chapter 7: Added the FSVH1924, FSVH2104, FSGA2577, and FSVH2892 packages to Table 7-4. Chapter 10: Added the XCVU13P-FSGA2577 device/package combination and the XCVU31P, XCVU33P, XCVU35P, and XCVU37P devices to Table 10-1. Chapter 13: Added a link to *Mechanical and Thermal Design Guidelines for Lidless Flip-Chip Packages Application Note (XAPP1301)*.
12/15/2017	1.9	Chapter 2, Package Files: Updated links and package designations in Table 2-1. Chapter 3, Device Diagrams: Updated package designations in Table 3-3 and Table 3-4. Added Figure 3-85, Figure 3-86, Figure 3-133, and Figure 3-134. Chapter 4, Mechanical Drawings: Updated package designations in Table 4-1. Added Figure 4-45. Updated Figure 4-46 (the dimensions inside the Top View changed). Added Figure 4-47. Chapter 10, Thermal Specifications: Added Note 2 to Table 10-1. Chapter 11, Thermal Management Strategy updated the System Level Heat Sink Solutions and Heat Sink Removal sections. Added the Measurement Debug section. Chapter 13, Mechanical and Thermal Design Guidelines for Lidless Flip-chip Packages was added to user guide.

Date	Version	Revision
8/25/2017	1.8	Chapter 1, Packaging Overview: In Table 1-4, corrected (increased) the available HP I/O pin counts for the XCKU095-FFVB2104. In Table 1-5, revised the VCCINT_IO description. In Table 1-7, updated the XCKU5P-FFVB676 mapping and added the XCKU095-FFVC1517. Added at Tip on page 57. Updated bank designations in Figure 1-8, Figure 1-13, Figure 1-15, Figure 1-28, Figure 1-32, Figure 1-35, all XCVU080 Bank Diagrams, XCVU095 Bank Diagrams, Figure 1-52, XCKU9P Bank Diagrams, Figure 1-79, XCKU13P Bank Diagrams, and XCKU15P and XQKU15P Bank Diagrams. Chapter 2, Package Files: Updated links and package designations in Table 2-1. Chapter 3, Device Diagrams: Updated package designations in Table 3-3 and Table 3-4. Added Figure 3-91 and Figure 3-92. Updated Figure 3-95 and Figure 3-96. Added Figure 3-113, Figure 3-114, Figure 3-127, Figure 3-128, Figure 3-135, and Figure 3-136. Chapter 4, Mechanical Drawings: Updated package designations in Table 4-1. Chapter 5, Package Marking: Updated the Top Marks for Figure 5-1 and Figure 5-2 to show the date code and lot number on the bar code version. Added package types to Table 5-1. Chapter 6, Packing and Shipping: Added package types to Table 6-1. Chapter 7, Soldering Guidelines: Added guidelines for lidless packages with stiffener ring and updated Table 7-1. Revised the Mass Reflow from 250°C to 245°C on a number of package types in Table 7-4. Revised Figure 7-3 with new guidelines. Chapter 10, Thermal Specifications: Added package types to Table 10-1. Added Documentation Navigator and Design Hubs in Appendix A.
4/27/2017	1.7.1	Replaced the FFVE1760 (XCKU15P) figures in Chapter 3, Device Diagrams.
4/26/2017	1.7	Added the XQKU040, XQKU060, XQKU095, and XQKU115 devices where applicable. Added the RBA676, RFA1156, RLD1517, and RLF1924 packages where applicable. Chapter 1, Packaging Overview: Updated Note 5 in Table 1-5. Revised Table 1-6, Table 1-7, and Table 1-9. Added notes and recommendations to the SYSMON, Configuration, PCIe, Interlaken, and 100GE Integrated Blocks section. Revised many of the Device Diagrams. Chapter 2, Package Files: Updated the links. Added and updated package files for Virtex UltraScale+ and Kintex UltraScale+ FPGAs. Chapter 3, Device Diagrams: Added and updated diagrams for Virtex UltraScale+ and Kintex UltraScale+ FPGAs. Chapter 4, Mechanical Drawings: Added and replaced many of the mechanical drawings for the Virtex UltraScale+ and Kintex UltraScale+ devices. Chapter 5, Package Marking: Updated the Virtex UltraScale and Kintex UltraScale device top-mark diagrams to include the bar code top-mark diagrams. Added the Virtex UltraScale+ and Kintex UltraScale+ device top-mark diagrams. Chapter 7, Soldering Guidelines: Added the Sn/Pb Reflow Soldering section. Updated the Conformal Coating recommendation.

Date	Version	Revision
4/25/2016	1.6	Added Kintex UltraScale+ and Virtex UltraScale+ FPGAs. Chapter 1, Packaging Overview: Revised GC or HDGC description and added RSVDGND to Table 1-5. Revised the Die Level Bank Numbering Overview section including adding and replacing figures and removing tables. Chapter 2, Package Files: Updated the links. Chapter 3, Device Diagrams: Corrected Figure 3-7 and Figure 3-8. Chapter 4, Mechanical Drawings: Updated top-lid flat-surface dimension from 31.05 sq. max. to 29.70sq. max. in Figure 4-12 (FFVA1156). Updated the top-lid flat-surface dimension from 29.10 max. to 29.70 sq. max. in Figure 4-13 (FFVA1156) and Figure 4-14 (FFVA1156). Added top-lid flat-surface dimension 33.10 in Figure 4-18 (FFVA1517). Update dimension A nominal from 3.61 to 3.51 in Figure 4-24 (FFVB1760). Updated Figure 4-38 (FLGB2104) to add a missing decimal point. Updated Figure 4-41 (FFVC2104) with the correct package dimensions. Chapter 7, Soldering Guidelines: Updated the device list in Table 7-4. Chapter 11, Thermal Management Strategy: Added a new recommendation and Figure 11-3.
10/19/2015	1.5	Added the XCKU025 and the XCKU095 in the FFVA1156 package. In Chapter 1, Packaging Overview, updated SFVA784 package in Table 1-7, Table 1-9 and Table 1-10. Updated the FLVB1760 rows in Table 1-9.Added an important note in Footprint Compatibility between Packages. Replaced Figure 1-13. In Chapter 3, Device Diagrams, replaced the SFVA784 drawings in Figure 3-3 and Figure 3-4 with updated pinouts. Updated Figure 3-43 and Figure 3-44. In Chapter 4, Mechanical Drawings, updated Figure 4-6 (SFVA784) and Figure 4-13 (FFVA1156), and corrected the heading for Figure 4-38 to include FLGB2104 and FLGC2104. Replaced Figure 4-38, Figure 4-50, Figure 4-51, and Figure 4-55. In Chapter 8, Recommended PCB Design Rules for BGA Packages, updated Table 8-1. In Chapter 10, Thermal Specifications, added thermal resistance data to Table 10-1. Substantial edits to the Introduction, Thermal Resistance Data, and Support for Thermal Models sections. Added a new recommendation on page 443. In Chapter 11, Thermal Management Strategy, removed *Design and Silicon* section, updated the Flip-Chip Packages and System Level Heat Sink Solutions sections, removed the *Thermal Management Options* section, added more information to Types of TIM, removed the *Comparing the Types of Interface Materials* section, added the Applied Pressure from Heat Sink to the Package via Thermal Interface Materials section, and removed the *Package Pressure Handling Capacity* section. In Chapter 12, Heat Sink Guidelines for Bare-die Flip-Chip Packages, removed the *Package Loading Specifications* section.
5/13/2015	1.4	Added the XCKU035 and XCKU040 devices in the SFVA784 package throughout this guide. Added XCKU085 and XCKU095 updates throughout including Table 1-7, Table 1-9, and Table 3-1. In Chapter 1, Packaging Overview, in Table 1-5 changed D01_DIN_0, D02_0, and D03_0 to bidirectional. Updated Figure 1-9 to Figure 1-14 with new GTH Quad placements. In Chapter 4, Mechanical Drawings, updated Table 4-1 and the specific mechanical drawings of the SFVA784, FBVA900, FLVA1517, FLVD1517, FLVB1760, FLVA2104, FLVB2104, FLGB2104, FFVC2104, FLVC2104, and FLGC2104.

Date	Version	Revision
3/23/2015	1.3	Updated the Differences from Previous Generations section. In Table 1-5, updated VCCINT and VCCAUX descriptions and the Multi-gigabit Serial Transceiver Pins (GTHE3 and GTYE3) section. Updated the Die Level Bank Numbering Overview section including adding the SYSMON, Configuration, PCIe, Interlaken, and 100GE Integrated Blocks section. Replaced Figure 1-4 through Figure 1-62 and updated information in Table 1-9 through Table 1-21. Removed the XCKU075 and XCKU100 throughout. Added the XCKU085 and XCKU095 where data is available. In Chapter 2, Package Files, updated the links to the ASCII files. In Chapter 3, Device Diagrams, updated Figure 3-13, Figure 3-14 and added numerous new figures. In Chapter 4, Mechanical Drawings, removed the FBVA900 mechanical drawings and updated Figure 4-21. In Chapter 5, Package Marking, added to the 2nd line description in Table 5-1. Revised Table 10-1.
1/12/2015	1.2	Revised the device/package combinations per the update to the *UltraScale Architecture and Product Overview* (DS890) [Ref 1]. This revision was throughout the guide in every table with package listings, Package Files, Device Diagrams, and Mechanical Drawings. Updated Table 1-16, Table 1-17, and replaced Table 1-18, Table 1-19, and Table 1-20. Updated descriptions in Table 5-1. Updated descriptions in Table 7-4. Revised and added to Table 10-1. Added references to Appendix A.

Date	Version	Revision
9/04/2014	1.1	Added a discussion on ULA materials on page 16. In Differences from Previous Generations, updated the differential clock pin pairs and the VREF pin discussion. Added the Virtex UltraScale FPGA packages to Table 1-1. Also added the Virtex UltraScale devices to Table 1-2, Table 1-4, and Table 1-6. Updated PERSTN[*0 to 1*], DOUT_CSO_B, FWE_FCS2_B, RS[*0 to 1*], RDWR_FCS_B_0, D00_MOSI_0, D01_DIN_0, and VREF_[bank number] descriptions. Updated Multi-gigabit Serial Transceiver Pins (GTHE3 and GTYE3) pin names. Added Table 1-7 and Table 1-9. Revised the T[*0 to 3*][*U or L*] and N[*0 to 12*] descriptions in the User I/O Pins section of Table 1-5: Pin Definitions. Updated the figures and added tables to the Die Level Bank Numbering Overview section. Changed the TXT and CSV files associated with Table 2-1. Also updated Table 2-1 with additional device/packages and links. In Chapter 3, Device Diagrams, replaced or added figures. Added Figure 4-1 through Figure 4-4. Replaced Figure 4-12 and Figure 4-13. Added Figure 4-18 through Figure 4-13. Added the Virtex UltraScale device package marking template to Chapter 5. Clarified the maximum reflow soldering guidelines on page 419 and updated Table 7-4: Peak Package Reflow Body Temperature(1). Replaced Figure 7-3. Removed the *Sn/Pb Reflow Soldering* section from Chapter 7, Soldering Guidelines. Added Post Reflow/Cleaning/Washing and Conformal Coating sections. Updated *Thermal Management Options* and Figure 10-2. Added Heat Sink Removal and *Package Pressure Handling Capacity* to Chapter 11. Updated the links to references [Ref 21], [Ref 22], and [Ref 23] in Appendix A. Added further references.
12/10/2013	1.0	Initial Xilinx release.

Table of Contents

Chapter 4: Mechanical Drawings

Packaging Overview

Introduction to the UltraScale Architecture

The Xilinx® UltraScale™ architecture is the first ASIC-class architecture to enable multi-hundred gigabit-per-second levels of system performance with smart processing, while efficiently routing and processing data on-chip. UltraScale architecture-based devices address a vast spectrum of high-bandwidth, high-utilization system requirements by using industry-leading technical innovations, including next-generation routing, ASIC-like clocking, 3D-on-3D ICs, multiprocessor SoC (MPSoC) technologies, and new power reduction features. The devices share many building blocks, providing scalability across process nodes and product families to leverage system-level investment across platforms.

Virtex® UltraScale+™ devices provide the highest performance and integration capabilities in a FinFET node, including both the highest serial I/O and signal processing bandwidth, as well as the highest on-chip memory density. As the industry's most capable FPGA family, the Virtex UltraScale+ devices are ideal for applications including 1+Tb/s networking and data center and fully integrated radar/early-warning systems.

Virtex UltraScale devices provide the greatest performance and integration at 20 nm, including serial I/O bandwidth and logic capacity. As the industry's only high-end FPGA at the 20 nm process node, this family is ideal for applications including 400G networking, large scale ASIC prototyping, and emulation.

Kintex® UltraScale+ devices provide the best price/performance/watt balance in a FinFET node, delivering the most cost-effective solution for high-end capabilities, including transceiver and memory interface line rates as well as 100G connectivity cores. Our newest mid-range family is ideal for both packet processing and DSP-intensive functions and is well suited for applications including wireless MIMO technology, Nx100G networking, and data center.

Kintex UltraScale devices provide the best price/performance/watt at 20 nm and include the highest signal processing bandwidth in a mid-range device, next-generation transceivers, and low-cost packaging for an optimum blend of capability and cost-effectiveness. The family is ideal for packet processing in 100G networking and data centers applications as well as DSP-intensive processing needed in next-generation medical imaging, 8k4k video, and heterogeneous wireless infrastructure.

Zynq® UltraScale+ MPSoC devices provide 64-bit processor scalability while combining real-time control with soft and hard engines for graphics, video, waveform, and packet processing. Integrating an Arm®-based system for advanced analytics and on-chip programmable logic for task acceleration creates unlimited possibilities for applications including 5G Wireless, next generation ADAS, and Industrial Internet-of-Things.

This packaging and pinout specification user guide is part of the UltraScale Architecture documentation suite available at: www.xilinx.com/ultrascale.

Introduction to UltraScale and UltraScale+ FPGAs Packaging and Pinouts

This section describes the packages and pinouts for the UltraScale architecture-based FPGAs in various organic flip-chip 0.8 mm and 1.0 mm pitch BGA packages.

- Kintex UltraScale and Kintex UltraScale+ devices are offered in low-cost, space-saving flip-chip and bare-die flip-chip packages that are optimally designed for high performance-to-price ratio.
- Virtex UltraScale and Virtex UltraScale+ devices are offered exclusively in high performance flip-chip BGA packages that are optimally designed for highest system capacity, bandwidth and signal performance. Package inductance is minimized as a result of optimal placement and even distribution as well as an increased number of power and GND pins.
- Zynq UltraScale+ MPSoCs are further described in the *Zynq UltraScale+ MPSoC Packaging and Pinouts User Guide* (UG1075) *[Ref 4]*.

IMPORTANT: *Many of the standard packages for commercial (XC) devices are lead-free (signified by an additional V in the package name). All of the UltraScale or UltraScale+ devices supported in a particular package are footprint compatible. Each device is split into I/O banks to allow for flexibility in the choice of I/O standards. See the UltraScale Architecture SelectIO Resources User Guide (UG571) [Ref 5].*

UltraScale and UltraScale+ device's flip-chip assembly materials are manufactured using ultra-low alpha (ULA) materials defined as <0.002 cph/cm^2 or materials that emit less than 0.002 alpha-particles per square centimeter per hour.

Differences from Previous Generations

The packaging and pinout specifications for UltraScale architecture-based FPGAs differ from past generations, including the 7 series devices. These details are outlined in this section.

- All packages are constructed on organic laminate substrates.
- Many of the package and die components, including flip-chip solder bumps, are lead-free. The FLGx devices have lead in their bumps.
- Package names contain a single-character alphabetic designator followed by the exact number of pins found on the package.
- VCCAUX_IO pins are not divided into bank groups. VCCAUX_IO must be connected to VCCAUX at the board level.
- Internal logic is separated from I/O logic by the addition of the VCCINT_IO power pins. VCCINT_IO must be connected to VCCINT at the board level.
- Groups of gigabit serial transceiver (GT) power pins are separated by column for each column of GT Quads/Duals.
- Standard I/O banks each have a total of 52 SelectIO™ pins, optionally configurable as up to 24 differential pairs.
- Each bank has one dedicated VREF pin. These pins cannot be used as user I/Os.
- Four differential clock pin pairs per bank (two per 26-pin bank) consist of a single type of global clock (GC) input.
- Four memory byte groups per I/O bank (two per 26-pin bank) are each separated into an upper and a lower memory byte group.
- All configuration pins are located in bank 0 and bank 65.
- A POR_OVERRIDE pin is used to override the default power-on-reset delay. See Table 1-5.

Device/Package Combinations

Table 1-1 shows the size and BGA pitch of the UltraScale and UltraScale+ device packages. The devices with stacked-silicon interconnect (SSI) technology are labeled.

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC, and the third digit in the package name is Q (for example: FFQA1156).*

Table 1-1: **Package Specifications**

Packages[1]	Description	Package Specifications		
		Package Type	Pitch (mm)	Size (mm)
FBVA676	Bare-die, flip-chip, fine-pitch	BGA	1.0	27 x 27
FFVA676	Flip-chip, fine-pitch			
FFVB676				
FFRB676	Ruggedized, flip-chip, fine-pitch			
RBA676				
SFVA784	Flip-chip, super-fine-pitch		0.8	23 x 23
SFVB784				
SFRB784	Ruggedized, flip-chip, super-fine pitch			
FBVA900	Bare-die, flip-chip, fine-pitch		1.0	31 x 31
FFVD900	Flip-chip, fine-pitch			
FFVE900

FLRA2104	Ruggedized, SSI, flip-chip, fine-pitch			47.5 x 47.5
FLRB2104				
FLRC2104				
FSGD2104	SSI, flip-chip, fine-pitch, lidless with stiffener ring, RoHS 6/6 with exemption 15			47.5 x 47.5
FSVH2104	SSI, flip-chip, fine-pitch, lidless with stiffener ring			47.5 x 47.5
FHGA2104[2]	SSI, flip-chip, fine-pitch, overhang, RoHS 6/6 with exemption 15			52.5 x 52.5
FHGB2104[2]				
FHGC2104[2]				
FIGD2104[2]	SSI, flip-chip, fine-pitch, overhang, lidless with stiffener ring, RoHS 6/6 with exemption 15			52.5 x 52.5
FLGB2377	SSI, flip-chip, fine-pitch, RoHS 6/6 with exemption 15			50 x 50
FLGA2577	SSI, flip-chip, fine-pitch, RoHS 6/6 with exemption 15			52.5 x 52.5
FSGA2577	SSI, flip-chip, fine-pitch, lidless with stiffener ring, RoHS 6/6 with exemption 15			52.5 x 52.5
FLGA2892	SSI, flip-chip, fine-pitch, RoHS 6/6 with exemption 15	BGA	1.0	55 x 55
FSVH2892	SSI, flip-chip, fine-pitch, lidless with stiffener ring			55 x 55

Table 1-1: **Package Specifications *(Cont'd)***

Packages[1]	Description	Package Specifications		
		Package Type	Pitch (mm)	Size (mm)
FSVA3824	SSI, flip-chip, fine-pitch, lidless with stiffener ring	BGA	1.0	65 x 65
FSVB3824	SSI, flip-chip, fine-pitch, lidless with stiffener ring	BGA	1.0	65 x 65

Notes:

1. FFV, FLV, and FLG packages are footprint compatible when the package code letter designator and pin count are identical. See *UltraScale Architecture and Product Overview* (DS890) [Ref 1] for specific letter codes and ordering code information.
2. These 52.5 x 52.5 packages have the same PCB ball footprint as the 47.5 x 47.5 packages and are footprint compatible.

Gigabit Transceiver Channels by Device/Package

Table 1-2 lists the quantity of gigabit transceiver channels for the UltraScale and UltraScale+ devices. In all devices, a gigabit transceiver channel is one set of MGTRXP, MGTRXN, MGTTXP, and MGTTXN pins. For transceiver data rate limitations on specific device/package combinations, see the specific *UltraScale and UltraScale+ device data sheets* [Ref 4].

User I/O Pins by Device/Package

Table 1-4 lists the number of available 3.3V-capable high-range (HR), 3.3V-capable high-density (HD), and 1.8V-capable high-performance (HP) I/Os and the number of differential I/O pairs for each UltraScale and UltraScale+ device/package combination.

IMPORTANT: *Because of package inductance, each device/package supports a limited number of simultaneous switching outputs. Limitations for specific applications can be determined using the Vivado Design Suite report_ssn tool. See the Simultaneous Switching Outputs section of the UltraScale Architecture SelectIO Resources User Guide (UG571) [Ref 5] for more information.*

Notes:

1. The maximum user I/O numbers do not include pins in the configuration bank 0 or the GT serial transceivers.

Pin Definitions

Table 1-5 lists the pin definitions used in UltraScale and UltraScale+ device packages.

Table 1-5: **Pin Definitions**

Pin Name	Type	Direction	Description
User I/O Pins			
IO_L[*1 to 24*][P or N]_T[*0 to 3*] [*U or L*]_N[*0 to 12*]_ [multi-function]_[bank number] or IO_T[*0 to 3*][*U or L*]_N[*0 to 12*]_[multi-function]_[bank number]			
	Dedicated	Input/ Output	Most user I/O pins are capable of differential signaling and can be implemented as pairs. Each user I/O pin name consists of several indicator labels, where: • IO indicates a user I/O pin. • L[*1 to 24*] indicates a unique differential pair with P (positive) and N (negative) sides. User I/O pins without the L indicator are single-ended. • T[*0 to 3*][*U or L*] indicates the assigned byte group and nibble location (upper or lower portion) within that group for the pin. • N[*0 to 12*] the number of the I/O within its byte group. • [*multi-function*] indicates any other functions that the pin can provide. If not used for this function, the pin can be a user I/O. • [*bank number*] indicates the assigned bank for the user I/O pin.
User I/O Multi-Function Pins			
GC or HDGC	Multi-function	Input/ Output	Four global clock (GC) pin pairs are in each bank. HDGC pins have direct access to the global clock buffers. GC pins have direct access to the global clock buffers, MMCMs, and PLLs that are in the clock management tile (CMT) adjacent to the same I/O bank. GC and HDGC inputs provide dedicated, high-speed access to the internal global and regional clock resources. GC and HDGC inputs use dedicated routing and must be used for clock inputs where the timing of various clocking features is imperative. GC or HDGC pins can be treated as user I/O when not used as input clocks. Up-to-date information about designing with the GC (or HDGC) pin is available in the *UltraScale Architecture Clocking Resources User Guide* (UG572) [Ref 6].
VRP(1)	Multi-function	N/A	This pin is for the DCI voltage reference resistor of P transistor (per bank, to be pulled Low with a reference resistor).

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
DBC QBC	Multi-function	Input	Byte lane clock (DBC and QBC) input pin pairs are clock inputs directly driving source synchronous clocks to the bit slices in the I/O banks. In memory applications, these are also known as DQS. For more information, consult the *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 5].
PERSTN[*0 to 1*]	Multi-function	Input	Default reset pin locations for the integrated block for PCI Express.
User I/O Multi-Function Configuration Pins			
For further descriptions, including configuration modes and recommended external pull-up/pull-down resistors, see the *UltraScale Architecture Configuration User Guide* (UG570) [Ref 7].			
EMCCLK	Multi-function	Input	External master configuration clock.
DOUT_CSO_B	Multi-function	Output	Data output for serial daisy-chaining or active-Low chip-select output for SelectMAP daisy-chaining.
D[*04 to 31*]	Multi-function	Bidirectional	Configuration data pins.
A[*00 to 28*]	Multi-function	Output	Address output.
CSI_ADV_B	Multi-function	Input or Output	Active-Low chip-select input or address valid output.
FOE_B	Multi-function	Output	Active-Low flash output enable.
FWE_FCS2_B	Multi-function	Output	Active-Low flash write-enable for BPI flash or flash chip-select for second SPI (x8) flash.
RS[*0 to 1*]	Multi-function	Output	Revision select outputs.
Dedicated (Bank 0) Configuration Pins(2)			
For more information see the *UltraScale Architecture Configuration User Guide* (UG570) [Ref 7].			
M[*0 to 2*]_0	Dedicated	Input	Configuration mode selection.
INIT_B_0	Dedicated	Bidirectional (open-drain)	Active-Low initialization

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
CFGBVS_0	Dedicated	Input	Bank 0 and bank 65 voltage select. This pin determines the I/O voltage operating range and voltage tolerance for the dedicated configuration bank 0 and multi-function bank 65. Connect CFGBVS High or Low per the bank voltage requirements. • V_{CCO_0} = 2.5V or 3.3V, tie CFGBVS High (connect to V_{CCO_0}). • V_{CCO_0} = 1.5V or 1.8V, tie CFGBVS Low (connect to GND) **CAUTION!** *To avoid device damage, this pin must be connected correctly to either V_{CCO_0} or GND.*
PUDC_B_0	Dedicated	Input	Active-Low input enables internal pull-ups during configuration on all SelectIO pins: 0 = Weak preconfiguration I/O pull-up resistors enabled. 1 = Weak preconfiguration I/O pull-up resistors disabled.
POR_OVERRIDE	Dedicated	Input	All configuration modes Power-on reset delay override. **CAUTION!** *Do not allow this pin to float before and during configuration. This pin must be tied to V_{CCINT} or GND. Do not connect to V_{CCO_0}.* Information about designing with the POR_OVERRIDE pin is available in the *UltraScale Architecture Configuration User Guide* (UG570) [Ref 7].
DONE_0	Dedicated	Bidirectional	Active-High, DONE indicates successful completion of configuration.
PROGRAM_B_0	Dedicated	Input	Active Low, asynchronous reset to configuration logic.
TDO_0	Dedicated	Output	JTAG test data output.
TDI_0	Dedicated	Input	JTAG test data input.
RDWR_FCS_B_0	Dedicated	Input/ Output	Input control signal for SelectMAP data bus direction: High for reading or Low for writing configuration data. Or, active-Low flash chip-select output.
TMS_0	Dedicated	Input	JTAG test mode data select.
TCK_0	Dedicated	Input	JTAG test clock
CCLK_0	Dedicated	Input/ Output	Configuration clock. Output in Master mode or input in Slave mode.
D00_MOSI_0	Dedicated	Bidirectional	Data Bit 0 or SPI master-output
D01_DIN_0	Dedicated	Bidirectional	Data Bit 1 or serial mode data input
D02_0	Dedicated	Bidirectional	Data Bit 2
D03_0	Dedicated	Bidirectional	Data Bit 3

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
Other Dedicated Pins			
DXN	Dedicated	N/A	Temperature-sensing diode pins (Anode: DXP; Cathode: DXN). The thermal diode is accessed by using the DXP and DXN pins in bank 0. When not used, tie to GND. To use the thermal diode an appropriate external thermal monitoring IC must be added. Consult the external thermal monitoring IC data sheet for usage guidelines.
DXP			
System Monitor Pins(3)			
AD[0 to 15][P or N]	Multi-function	Input	System Monitor differential auxiliary analog inputs 0–15.
VCCADC	Dedicated	N/A	System Monitor analog positive supply voltage.
GNDADC	Dedicated	N/A	System Monitor analog ground reference.
VREFP	Dedicated	N/A	Voltage reference input.
VREFN	Dedicated	N/A	Voltage reference GND.
VP	Dedicated	Input	System Monitor dedicated differential analog input (positive side).
VN	Dedicated	Input	System Monitor dedicated differential analog input (negative side).
I2C_SCLK	Multi-function	Bidirectional	I2C serial clock. Directly connected to the System Monitor DRP interface for I2C operation configuration.  **IMPORTANT:** *Because the SYSMON I2C interface is active after power-on, this pin should only be used for I2C access until after configuration.*
I2C_SDA	Multi-function	Bidirectional	I2C serial data line. Directly connected to the System Monitor DRP interface for I2C operation configuration.  **IMPORTANT:** *Because the SYSMON I2C interface is active after power-on, this pin should only be used for I2C access until after configuration.*

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
SMBALERT	Multi-function	Bidirectional	Optional PMBus alert, interrupt signal. When Low, indicates a system fault that must be cleared using PMBus commands. Connect to SMBALERT_TS. For more information, see the *UltraScale Architecture System Monitor User Guide* (UG580) [Ref 10].  **IMPORTANT:** *By default, the PMBus is active prior to configuration. Only use as a multi-functional I/O pin in designs that can tolerated this pin being driven prior to configuration.* This pin is present on Kintex UltraScale+ and Virtex UltraScale+ devices.
Power/Ground Pins			
For more information on voltage specifications see the *UltraScale and UltraScale+ device data sheets* [Ref 3].			
GND	Dedicated	N/A	Ground.
VCCINT	Dedicated	N/A	Power-supply pins for the internal logic.
VCCINT_IO	Dedicated	N/A	Power-supply pins for the I/O banks. For Kintex and Virtex UltraScale devices, connect VCCINT_IO to VCCINT. For Kintex and Virtex UltraScale+ devices, connect VCCINT_IO to VCCBRAM. Both migration and lower voltage differences (-1LI and -2LE at 0.72V) are discussed in the *UltraScale Architecture PCB and Pin Planning User Guide* (UG583). See the connection matrix in the *Power Supply Voltage Levels and VCCINT_IO Connection* section [Ref 11].
VCCINT_GT_[*L or R*]	Dedicated	N/A	GTM core power-supply pins.
VCCAUX	Dedicated	N/A	Power-supply pins for auxiliary circuits.
VCCAUX_IO	Dedicated	N/A	Auxiliary power-supply pins for the I/O banks. VCCAUX_IO must be connected to VCCAUX on the board. ***Note:*** Package files for XQ ruggedized Kintex and Virtex UltraScale+devices (for example: FFRB676) have unique pin names for VCCAUX_HPIO and VCCAUX_HDIO. These pins can be connected to a common VCCAUX_IO supply.
VCCIO_HBM_[HBM bank number]	Dedicated	N/A	HBM component I/O power supply (VDDQ)
VCC_HBM_[HBM bank number]	Dedicated	N/A	HBM component core power supply (VDDC)
VCCAUX_HBM_[HBM bank number]	Dedicated	N/A	HBM component word line voltage pump (VPP)
VCCBRAM	Dedicated	N/A	Block RAM power supply pins.

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
VBATT	Dedicated	N/A	Decryptor key memory backup supply; this pin should be tied to the appropriate V_{CC} or GND when not used.
VCCO_[bank number](4)	Dedicated	N/A	Power-supply pins for the output drivers (per bank).
VREF_[bank number]	Dedicated	N/A	These are input threshold voltage pins.
RSVDGND	Dedicated	N/A	Reserved pins—must be tied to GND. These pins are present on Kintex UltraScale+ and Virtex UltraScale+ devices. **TIP:** *In footprint compatible devices, this pin can be labeled differently and serve different purposes. When planning migration between devices, include the functionality between all footprint compatible devices.*
RSVD	Dedicated	N/A	Reserved pins—leave floating. **TIP:** *In footprint compatible devices, this pin can be labeled differently and serve different purposes. When planning migration between devices, include the functionality between all footprint compatible devices.*
Multi-gigabit Serial Transceiver Pins (GTHE3 and GTYE3)			
For more information on the GTH and GTY transceivers see the *UltraScale Architecture GTH Transceivers User Guide* (UG576)[Ref 8] or *UltraScale Architecture GTY Transceivers User Guide* [Ref 9].			
MGTHRX[P or N][0 to 3] _[GT quad number]	Dedicated	Input	Differential receive port GTH Quad.
MGTHTX[P or N][0 to 3] _[GT quad number]	Dedicated	Output	Differential transmit port GTH Quad.
MGTYRX[P or N][0 to 3] _[GT quad number]	Dedicated	Input	Differential receive port GTY Quad.
MGTYTX[P or N][0 to 3] _[GT quad number]	Dedicated	Output	Differential transmit port GTY Quad.
MGTYRX[P or N][0 to 3] _[GT dual number]	Dedicated	Input	Differential receive port GTM Dual.
MGTYTX[P or N][0 to 3] _[GT dual number]	Dedicated	Output	Differential transmit port GTM Dual.
MGTAVCC_[L or R] [N, UC, C, LC, or S](5)	Dedicated	Input	Analog power-supply pin for the receiver and transmitter internal circuits.

Table 1-5: **Pin Definitions *(Cont'd)***

Pin Name	Type	Direction	Description
MGTAVTT_[L or R] [N, UC, C, LC, or S](5)	Dedicated	Input	Analog power-supply pin for the transmit driver.
MGTVCCAUX_[L or R] [N, UC, C, LC, or S](5)	Dedicated	Input	Auxiliary analog Quad PLL (QPLL) voltage supply for the transceivers.
MGTREFCLK[0 or 1] [P or N]	Dedicated	Input	Differential reference clock for the transceivers.
MGTAVTTRCAL_[L or R] [N, UC, C, LC, or S](5)	Dedicated	N/A	Precision reference resistor pin for internal calibration termination.
MGTRREF_[L or R] [N, UC, C, LC, or S](5)	Dedicated	Input	Precision reference resistor pin for internal calibration termination.

Notes:

1. See the DCI sections in *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 5] for more information on the VRP pins.
2. All dedicated configuration pins are powered by V_{CCO_0}.
3. See the *UltraScale Architecture System Monitor User Guide* (UG580) [Ref 10] for the default connections required to support on-chip monitoring.
4. V_{CCO} pins in unbonded banks must be connected to the V_{CCO} for that bank (for package migration). Do NOT connect unbonded V_{CCO} pins to different supplies. Without a package migration requirement, V_{CCO} pins in unbonded banks can be tied to a common supply (V_{CCO} or GND).
5. L (left) or R (right) plus N (north), UC (upper center), C (center), LC (lower center), and S (south) signify the GT transceiver quad power supply groups. For example, RUC signifies the right-upper-center power supply group and LLC signifies the left-lower-center power supply group in the FLGA2577 package.

Footprint Compatibility between Packages

UltraScale and UltraScale+ devices are footprint compatible only with other UltraScale and UltraScale+ devices with the same number of package pins and the same preceding alphabetic designator. For example, XCKU060-FFVA1517 is compatible with XCKU085-FLVA1517 and XCKU115-FLVA1517, but not with XCKU115-FLVD1517. Pins that are available in one device but are not available in another device with a compatible package include the other device's name in the *No Connect* column of the package file. These pins are labeled as *No Connects* in the other device's package file.

IMPORTANT: *Footprint compatibility does not necessarily imply that all pins will function in the same manner for different devices in a package. For limitations and guidelines on designing for footprint compatible packages, refer to the Migration Between UltraScale Devices and Packages section of UltraScale Architecture PCB and Pin Planning User Guide (UG583)* [Ref 11].

Table 1-6 shows the footprint compatible devices available for each UltraScale and UltraScale+ device package. See *UltraScale Architecture and Product Overview* (DS890) [Ref 1] for specific package letter code options.

IMPORTANT: *The height dimensions of footprint compatible packages can vary since some devices contain SSI technology.*

B3824	XCVU19P												

Notes:

1. While footprint compatible, the body size for the VU13P, VU27P, and VU39P is 52.5 mm, which is larger than the 47.5 mm for a 2104 ball package.

Many UltraScale and UltraScale+ devices that are footprint compatible in a package have different I/O bank and transceiver quad numbers connected to the same package pins. Due to these differences, when migrating between devices in a specific package, the type of bank (HP vs. HR) or quad (GTH vs. GTY), whether a bank is connected or NC at the package pins, and where the bank or quad is located on the die must be taken into consideration. Table 1-7 and Table 1-9 show how the banks and transceiver quads are numbered between devices in each package.

For all grouped-together footprint compatible packages, the bank and quad numbers in the same column for each device are connect to the same package pins. For example, in the FFVD1517 and FLVD1517 packages, bank 69 for the XCVU095 is connected to the same pins as bank 71 for the XCVU125.

A limited number of banks have fewer than 52 SelectIO pins. For a visual representation of all of this information, see the Die Level Bank Numbering Overview section.

For each grouped set of footprint compatible packages listed in Table 1-9, there is a row detailing the power supply group for each quad. These groups are labeled according to the regions for the transceiver power supply pins, as listed in the ASCII Pinout Files linked from Chapter 2, Package Files. For a visual representation of all of this information, see the Die Level Bank Numbering Overview section.

Die Level Bank Numbering Overview

Banking and Clocking Summary

- For each device, not all banks are bonded out in every package.

GTH/GTY/GTM Columns

- One GTH/GTY Quad = Four transceivers = Four GTHE3 or GTYE3 primitives.
- One GTM Dual = Two transceivers = Two GTME3 primitives
- Not all GT Quads/Duals are bonded out in every package.
- Also shown are quads/duals labeled with RCAL. This specifies the location of the RCAL masters for each device. With respect to the package, the RCAL masters are located on the same package pin for each package, regardless of the device.
- The XY coordinates shown in each quad/dual correspond to the transceiver channel number found in the pin names for that quad/dual, as shown in Figure 1-1.
- An alphabetic designator is shown in each quad/dual. Each letter corresponds to the columns in Table 1-7 and Table 1-9.
- The power supply group is shown in brackets [ ] for each quad/dual.

I/O Banks

- Each user I/O bank has a total of 52 I/Os where 48 can be used as differential (24 differential pairs) or single-ended I/Os. The remaining four function only as single-ended I/Os. All 52 pads of a bank are not always bonded out to pins.
- A limited number of banks have fewer than 52 SelectIO pins. These banks are labeled as partial.
- Adjacent to each bank is a physical layer (PHY) containing a CMT and other clock resources.
- Adjacent to each bank and PHY is a tile of logic resources that makes up a clock region.
- Banks are arranged in columns and separated into rows which are pitch-matched with adjacent PHY, clock regions, and GT blocks.
- An alphabetic designator is shown in each bank. Each letter corresponds to the columns in Table 1-7 and Table 1-9.

Clocking

- Each bank has four pairs of global clock (GC) inputs for four differential or four single-ended clock inputs. Single-ended clock inputs should be connected to the P side of the differential pair.
- Clock signals are distributed through global buffers driving routing and distribution networks to reach any clock region, I/O, or GT.
- Global clock inputs can connect to an MMCM and two PLLs within the horizontally adjacent CMT.

Bank Locations of Dedicated and Multi-Function Pins

- In all UltraScale and UltraScale+ devices, bank 65 contains the multi-function configuration pins. Bank 0 contains the dedicated configuration pins.
- In Figure 1-2 through Figure 1-115, the multi-function configuration bank 65 is shown adjacent to the SYSMON/CFG blocks. For devices with multiple super logic regions (SLRs), banks 60 and 70 are also shown adjacent to the SYSMON/CFG blocks. Due to the architectural differences between these and other banks, special consideration must be taken when using them under certain conditions. See the State of I/Os During and After Configuration and the Special DCI Requirements in Some Banks sections of *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 5] for details.
- For UltraScale devices, all dedicated configuration I/Os (bank 0) and HR I/Os are 1.5V to 3.3V capable.
- For UltraScale+ devices, all dedicated configuration I/Os (bank 0) and HR I/Os are 1.5V to 1.8V capable.

SYSMON, Configuration, PCIe, Interlaken, and 100GE Integrated Blocks

- CFG: Configuration block
- SYSMON/CFG: Block shared between SYSMON and configuration
- PCIe: Integrated block for PCIe

  Note: Do not connect the Integrated block for PCIe to transceiver channels through an SLR crossing. For further details, refer to the *Placement Rules* section of the *UltraScale Devices Gen3 Integrated Block for PCI Express Product Guide* (PG156) [Ref 14] and *UltraScale+ Devices Integrated Block for PCI Express Product Guide* (PG213) [Ref 15]. PCIe blocks with an additional (Tandem) label support tandem configuration.
- ILKN: Interlaken block

  Note: Do not connect the Interlaken block to transceiver channels through an SLR crossing. For further details, refer to the *Transceiver Interface* section of the *Integrated Interlaken 150G Product Guide* (PG169) [Ref 16].

- CMAC: 100G Ethernet block

  Note: Do not connect the 100G Ethernet block to transceiver channels through an SLR crossing. For further details, refer to the *Transceiver Selection Rules* section of the *UltraScale Devices Integrated Block for 100G Ethernet Product Guide* (PG165) [Ref 17] or *UltraScale+ Devices Integrated 100G Ethernet Subsystem Product Guide* (PG203) [Ref 18].

Device Diagrams

Figure 1-1 shows an example diagram with a brief explanation for each component.

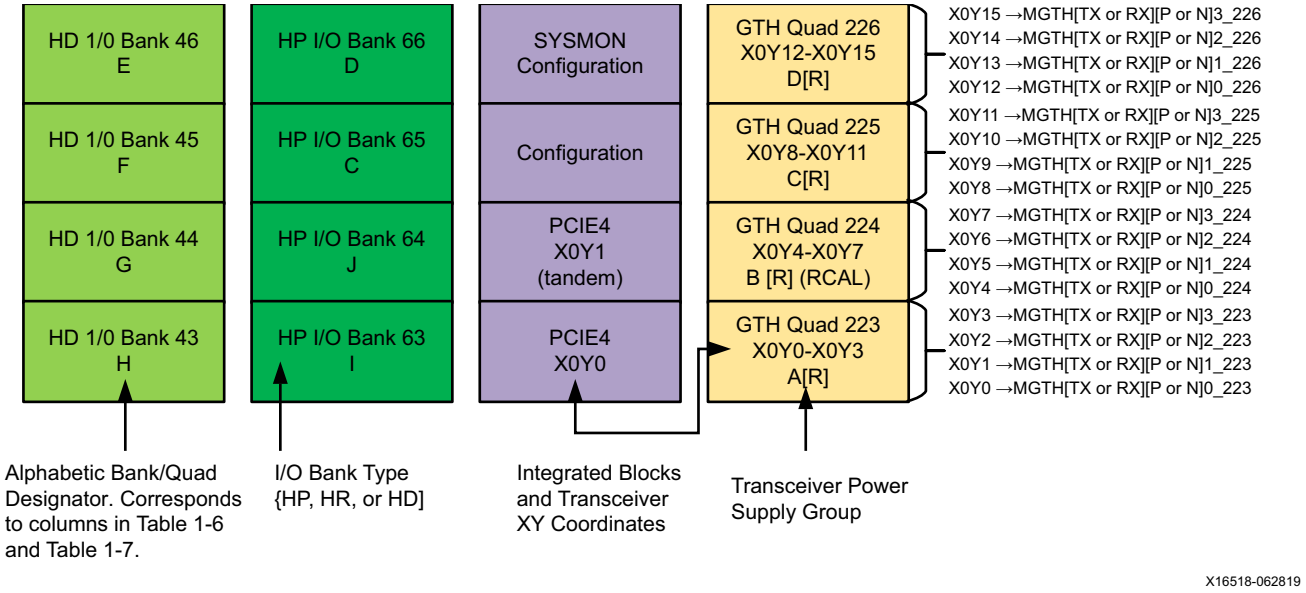

Figure 1-1: **Example Device Diagram**

TIP: *Due to design limitations, the device resources might be less than what is shown in the device diagrams. The actual available resources by device and package are listed in the UltraScale Architecture and Product Overview (DS890) [Ref 1].*

The following figures show a die view of each device followed by a view with respect to each available package.

Package Files

About ASCII Package Files

The ASCII package files for each package include a comma-separated-values (CSV) version and a text version optimized for a browser or text editor in fixed-width fonts. The information in each of the files includes:

- Device/Package name (*family-device-package*), with date and time of creation
- Seven columns containing data for each pin:
  - Pin—Pin location on the package.
  - Pin Name—The name of the assigned pin.
  - Memory Byte Group—Memory byte group between 0 and 3 split into upper (U) and lower (L) halves. For more information on the memory byte group, see the *UltraScale Architecture FPGAs Memory IP Product Guide* (PG150) [Ref 13].
  - Bank—Bank number.
  - I/O Type—CONFIG, HD, HR, HP, or GT (GTH, GTY, or GTM) depending on the I/O type. For more information on the I/O type, see the *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 5].
  - Super Logic Region—Number corresponding to the super logic region (SLR) in the devices implemented with stacked silicon interconnect (SSI) technology.
  - No-Connect—This list of devices is used for migration between devices that have the same package size and are not connected at that specific pin.
- Total number of pins in the package.

Package Specifications Designations

Package specifications are designated as evaluation only, engineering sample, or production. Each designation is defined as follows.

Evaluation Only

These package specifications are based on initial device specifications, package routability analysis and mechanical package construction. Package specifications with this designation are not stable and package pinouts are likely to change and these specifications should only be used for initial system level design feasibility.

Engineering Sample

These package specifications are based on a released package design and validated with ES engineering sample (ES) devices. Package specifications with this designation are considered stable, however some pinout and mechanical specifications might change prior to the production release of the particular device. Package pinouts with this designation are to be used for PCB and Vivado designs using ES devices.

Production

These package specifications are released coincident with production release of a particular device. Customers receive formal notification of any subsequent changes.

ASCII Pinout Files

Links to the ASCII pinout information by device/package are listed in Table 2-1. The pinouts of XQ devices are identical to the pinouts of their equivalent XC devices in footprint compatible package. Links in this table to XQ devices open the XC version of the pinout file. For example, the link to RBA676-XQKU040 opens the FBVA676-XCKU040 pinout file.

Download all available Kintex UltraScale, Kintex UltraScale+, Virtex UltraScale, and Virtex UltraScale+ FPGA package/device/pinout files at:

www.xilinx.com/support/package-pinout-files/ultrascale-pkgs.html

Note: All package files are ASCII files in TXT and CSV file format. Only the available files listed in Table 2-1 are linked and consolidated in this ZIP file.

www.xilinx.com/support/packagefiles/usapackages/usaall.zip

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC, and the third digit in the package name is Q (for example: FFQA1156).*

Device Diagrams

Summary

The diagrams in this chapter show a top-view perspective of the package pinout of each UltraScale and UltraScale+ device/package combination. Table 3-1 through Table 3-4 contain cross references to the device diagrams. The I/O-bank diagram shows the location of each user I/O and GTH/GTY transceiver and the respective bank or GT quad. The configuration-power diagram shows the location of every power pin and dedicated as well as multi-function configuration pin in the package. See Package Specifications Designations in Chapter 2 for definitions of Evaluation Only, Engineering Sample, and Production device diagrams.

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC, and the third digit in the package name is Q (for example: FFQA1156).*

Mechanical Drawings

Summary

This chapter provides mechanical drawings (package specifications) of the UltraScale and UltraScale+ device packages. Table 4-1 is a cross-reference to the mechanical drawings by device and package combination.

All Kintex and Virtex UltraScale+ devices are available in packages with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC and the third digit in the package name replaces the V or G with a Q to delineate the use of eutectic balls on an otherwise XC package. For information on ordering the XQ non-ruggedized eutectic Sn/Pb ball packages, see the XQ UltraScale+ FPGA Ordering Information in the *XQ UltraScale Architecture Data Sheet Overview* (DS895) [Ref 2]. For the XQ non-ruggedized eutectic Sn/Pb ball packages mechanicals, refer to the XC packages in Table 4-1 because they are built with an XC style package and lid using Pb-free solder inside.

In Table 4-1, the full Defense-grade XQ ruggedized packages are delineated by an R in the third digit of the package code.

Package Marking

Introduction

The package top-markings for the UltraScale™ and UltraScale+™ devices are similar to the examples shown in Figure 5-1, Figure 5-2, Figure 5-3, and Figure 5-4. Figure 5-1 and Figure 5-2 show both old and changed top markings. In addition to the markings explained in Table 5-1, refer to the *FAQ: Top Marking Change for 7 Series, UltraScale, and UltraScale+ Products* (XTP424) [Ref 12].

The package top-markings for the XQ Kintex UltraScale+ and XQ Virtex UltraScale+ devices are as shown in Figure 5-5. On XQ products only the Xilinx logo and the 2D bar code are marked.

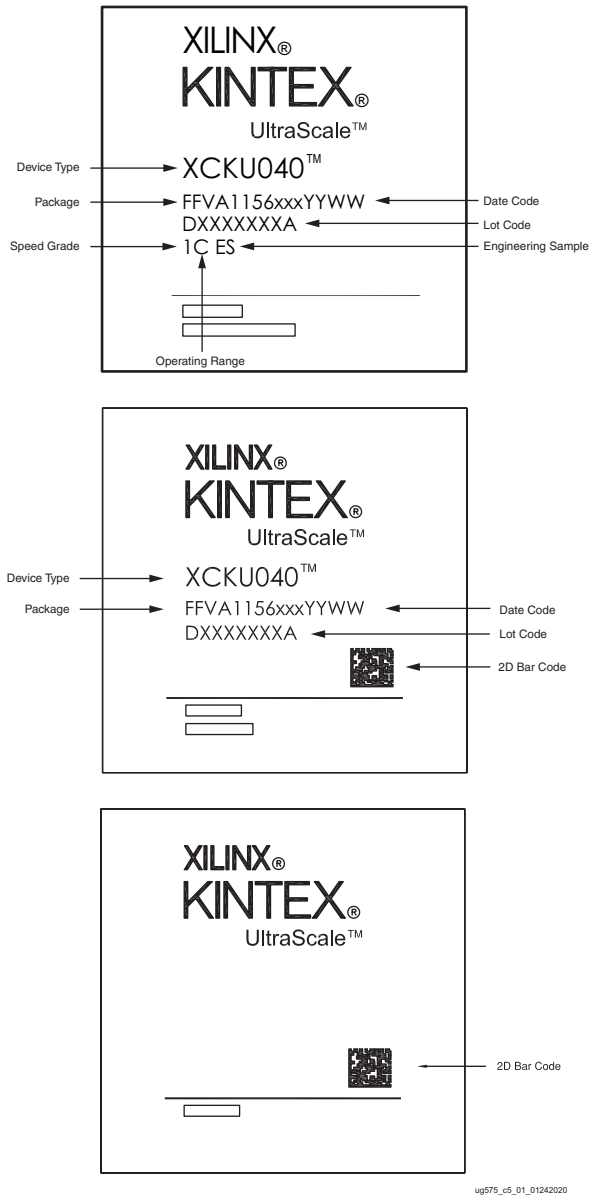

Figure 5-1: **Kintex UltraScale Device Package Marking**

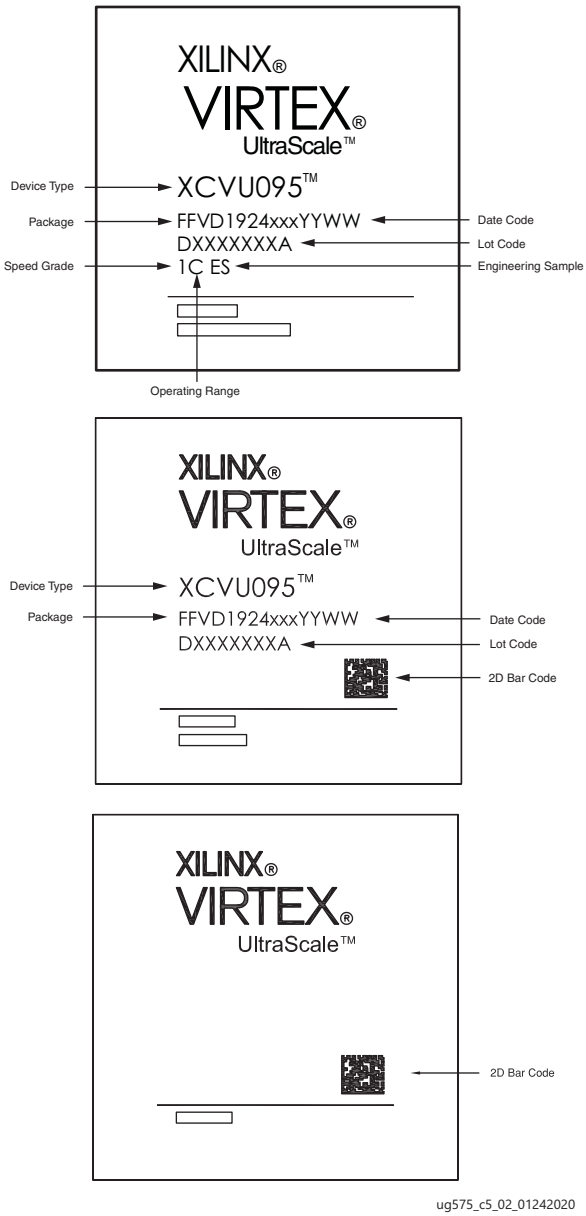

Figure 5-2: **Virtex UltraScale Device Package Marking**

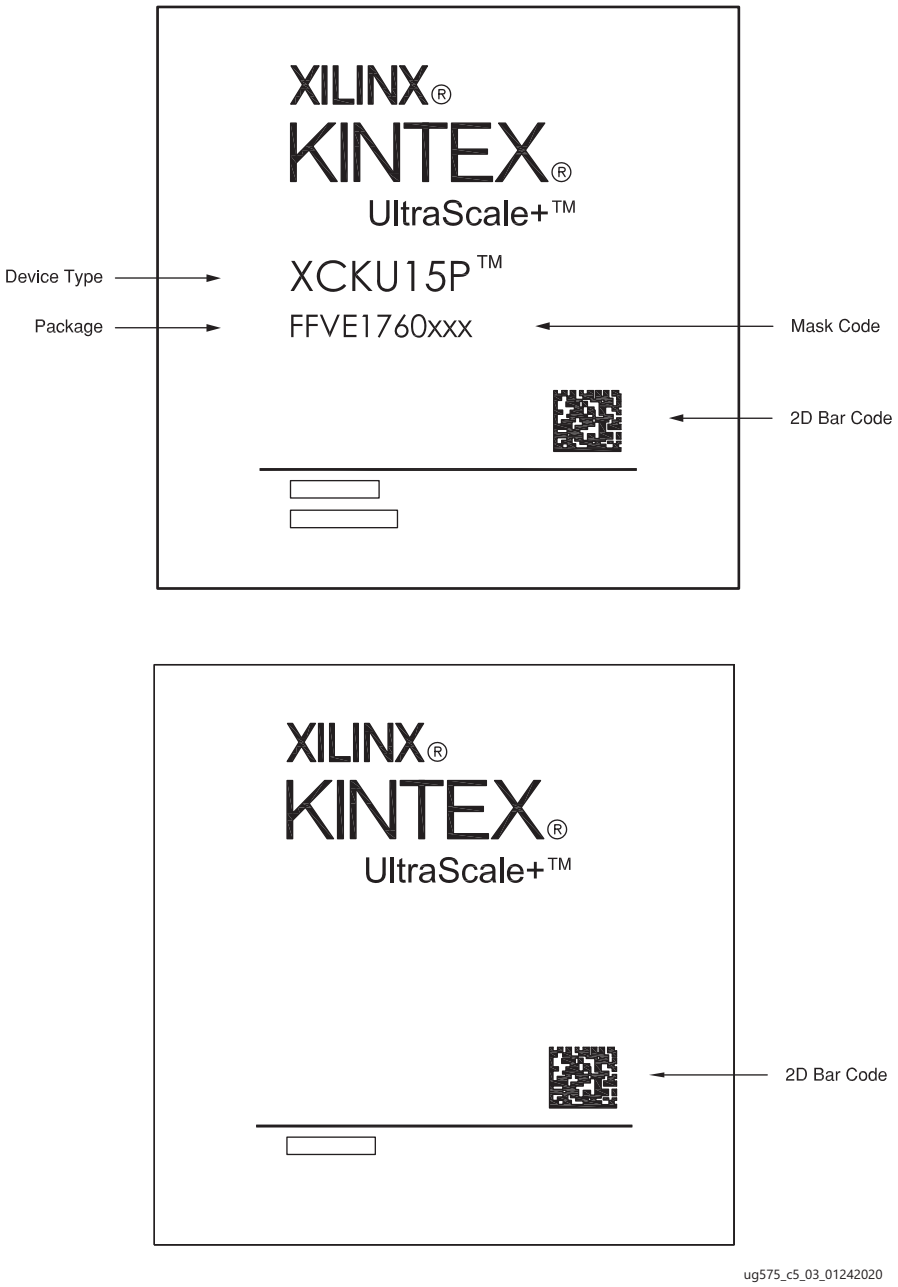

Figure 5-3: **Kintex UltraScale+ Device Package Marking**

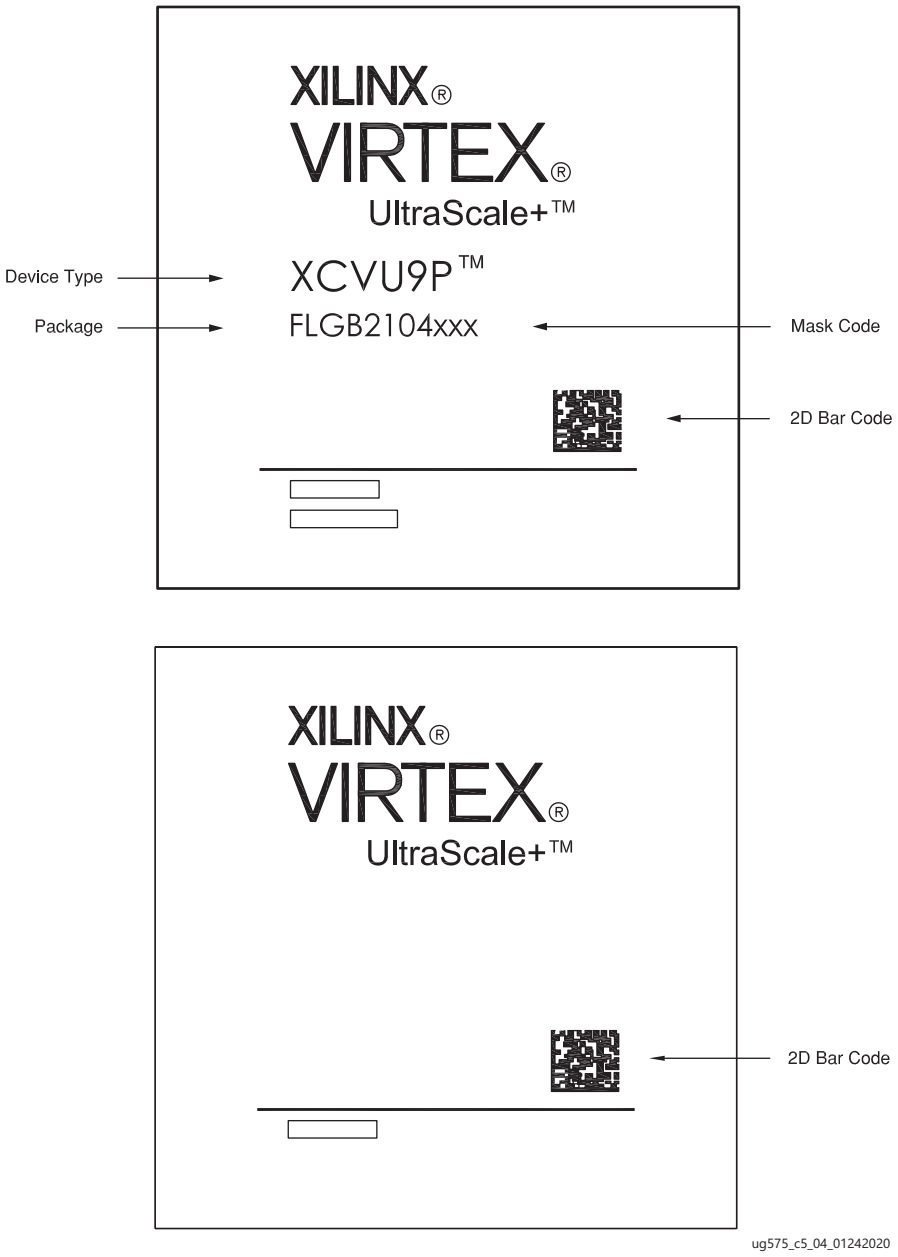

Figure 5-4: **Virtex UltraScale+ Device Package Marking**

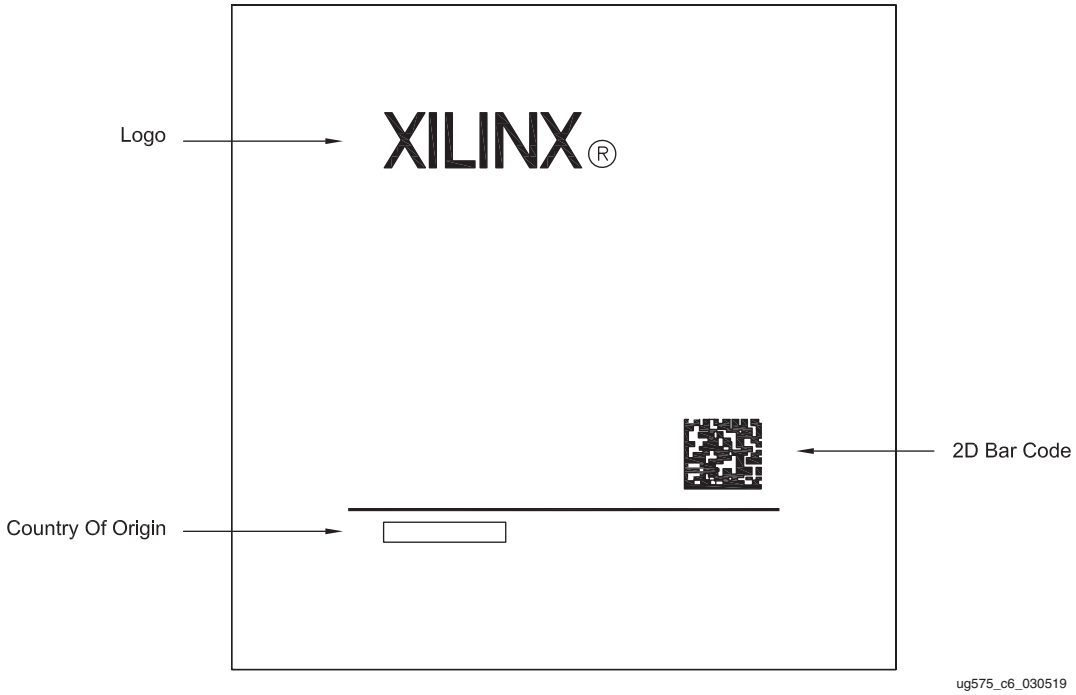

Figure 5-5: **XQ Kintex UltraScale+ and XQ Virtex UltraScale+ Device Package Marking**

Table 5-1: **XC Device Marking Definition—Example**

Item	Definition	
Xilinx Logo	Xilinx logo, Xilinx name with trademark, and trademark-registered status.	
Family Brand Logo	Device family name with trademark and trademark-registered status. This line is optional and could appear blank.	
1st Line	Device name. This line is not marked on some devices. Refer to the bar code for device information.	
2nd Line	This line is not marked on some devices. Refer to the bar code for device information. • Package code: **FF** 1st digit: F for flip-chip BGA, S for flip-chip BGA with 0.8 mm ball pitch. 2nd digit: F for lidded, L for lidded SSI, B for bare-die, H for overhang SSI, S for lidless SSI stiffener, and I for overhang lidless SSI stiffener. • 3rd digit: Pb-free code: **V** for RoHS 6/6, **G** for RoHS 6/6 with exemption 15, or for packages with eutectic BGA balls (**R** or **Q**). All commercial (XC) UltraScale Architecture devices have Pb-free RoHS compliant packaging. For more details on Xilinx Pb-free and RoHS compliant products, see: www.xilinx.com/pbfree. • 4th digit: This is the pin out (net list) identifier. • 5th–8th digits: These are the physical pin count identifiers: **A1156** and **D1924** are shown in the Figure 5-1 and Figure 5-2 example marking drawings. Example: A package code of FFVA1517 and FFVC1517 means they have a different pinout (net list) but the same physical ball count and physical dimensions. • Three letter circuit design revision, the location code for the wafer fab, and the geometry code (**xxx**). Designated as the mask code in some figures. • When marked, the date code: **YYWW** (two digit year and work week). This code is not marked on some devices. Refer to the bar code for more information.	
3rd Line	When marked, this line describes ten alphanumeric characters for assembly location, 7-digit lot number, and step information. The last digit is usually an A or an M if a stepping version does not exist. This line is not marked on some devices. Refer to the bar code for more information.	
4th Line	When marked, this line describes the device speed grade (**1**) and temperature operating range (**C**). When not marked on the package, the product is considered to operate at the extended (**E**) temperature range. If a bar code is present on the device, the 4th line might be blank or unmarked. In this case, refer to the bar code for speed grade and temperature range information. For more information on the ordering codes, see the *UltraScale Architecture and Product Overview* (DS890) [Ref 1]. Other variations for the 4th line:	
	L1I	The L1I indicates a -1LI device. The -1LI speed grade offers reduced maximum power consumption. For more information, see the specific device's data sheet [Ref 3].
	1C xxxx	The xxxx indicates a 4-digit SCD device option. An SCD is a special ordering code that is not always marked in the device top mark.
	1C ES 2E ES L1I ES	The addition of an ES after the operating temperature range code indicates an engineering sample.
Bar Code	A device-specific bar code is marked on each device. Refer to the *FAQ: Top Marking Change for 7 Series, UltraScale, and UltraScale+ Products* (XTP424) [Ref 12].	

Packing and Shipping

Introduction

The UltraScale and UltraScale+ devices are packed in trays. Trays are used to pack most of Xilinx surface-mount devices since they provide excellent protection from mechanical damage. In addition, they are manufactured using anti-static material to provide limited protection against ESD damage and can withstand a bake temperature of 125°C.

Table 6-1: **Standard Device Counts per Tray and Box**

Package	Maximum Number of Devices Per Tray	Maximum Number of Units In One Internal Box
FBVA676, RBA676	40	200
FFVA676, FFVB676, RRFB676	40	200
SFVA784, SFVB784, SFRB7784	60	300
FBVA900	27	135
FFVD900, FFVE900	27	135
FFVA1156, RFA1156, FFRA1156	24	120
FFVA1517, FFVC1517, FFVD1517, FFVE1517, FFRC1517, FFRE1517	21	105
FLVA1517, FLVD1517, RLD1517	21	63

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC, and the third digit in the package name is Q (for example: FFQA1156).*

Soldering Guidelines

Soldering Guidelines

To implement and control the production of surface-mount assemblies, the dynamics of the Pb-free solder reflow process and how each element of the process is related to the end result must be thoroughly understood.

RECOMMENDED: *Xilinx recommends that customers qualify their custom PCB assembly processes using package samples.*

The primary phases of the Pb-free reflow process are:

- Melting the particles in the solder paste
- Wetting the surfaces to be joined
- Solidifying the solder into a strong metallurgical bond

The peak reflow temperature of a plastic surface-mount component (PSMC) body should not be more than 250°C maximum (260°C for dry rework only) for Pb-free packages (220°C for eutectic packages), and is package size dependent. For multiple BGAs in a single board and because of surrounding component differences, Xilinx recommends checking all BGA sites for varying temperatures.

The infrared reflow (IR) process is strongly dependent on equipment and loading. Components might overheat due to lack of thermal constraints. Unbalanced loading can lead to significant temperature variation on the board. These guidelines are intended to assist users in avoiding damage to the components; the actual profile should be determined by those using these guidelines. For complete information on package moisture / reflow classification and package reflow conditions, refer to the Joint IPC/JEDEC Standard J-STD-020C.

Sn/Pb Reflow Soldering

Figure 7-1 shows typical conditions for solder reflow processing of Sn/Pb soldering using IR/convection. Both IR and convection furnaces are used for BGA assembly. The moisture sensitivity of PSMCs must be verified prior to surface-mount flow.

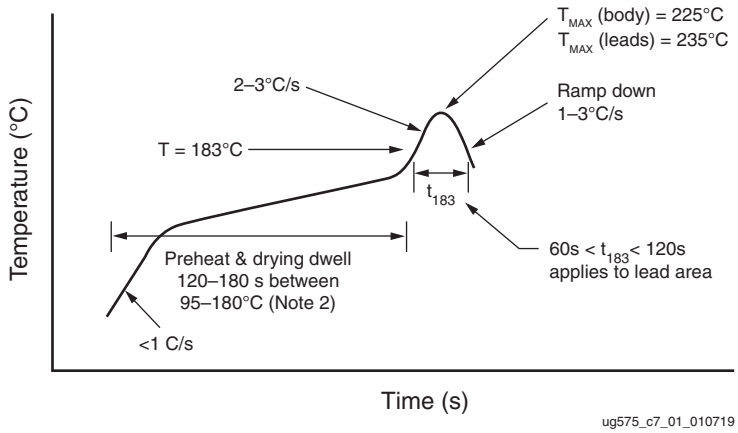

Figure 7-1: **Typical Conditions for IR Reflow Soldering of Sn/Pb Solder**

Notes for Figure 7-1:

1. Maximum temperature range = 225°C (body). Minimum temperature range = 205°C (leads/balls).
2. Preheat dwell 95–180°C for 120–180 seconds.
3. IR reflow must be performed on dry packages.

Typical Conditions for IR Reflow Soldering of Ceramic Column Grid Array Packages

Figure 7-2 shows typical conditions for solder reflow processing of Sn/Pb soldering using IR/convection for ceramic column grid array packages (CN). Both IR and convection furnaces are used for BGA assembly. The moisture sensitivity of PSMCs must be verified prior to surface-mount flow.

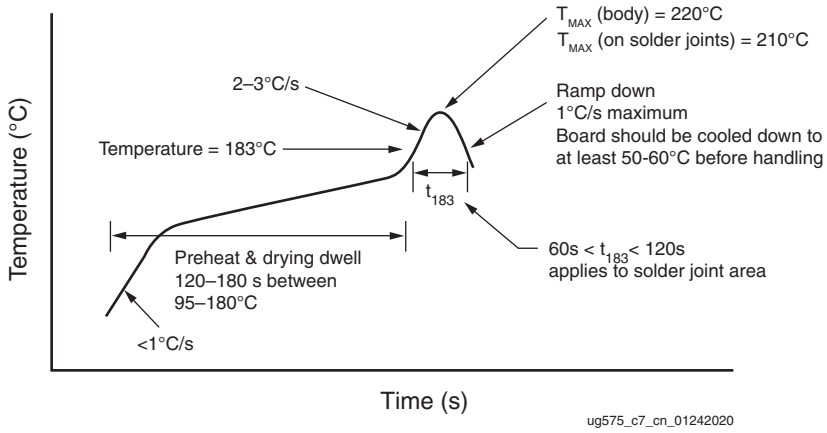

Figure 7-2: **CN Package Soldering Guidelines**

Notes for Figure 7-2:

1. Maximum temperature range = 220°C (body). Minimum temperature range = 205°C (solder joints).
2. Preheat dwell 95–180°C for 120–180 seconds.
3. IR reflow must be performed on dry packages.
4. Board should be cooled down to at least 50-60ºC before handling.
5. Reflow atmosphere of nitrogen is recommended.
6. These parameters are guidelines only. Always use the best manufacturing practices.

Pb-Free Reflow Soldering

Xilinx uses SnAgCu solder balls for BGA packages. In addition, suitable package materials are qualified for the higher reflow temperatures (250°C maximum, 260°C for dry rework only) required by Pb-free soldering processes.

Xilinx does not support soldering SnAgCu BGA packages with SnPb solder paste using a Sn/Pb soldering process. Traditional Sn/Pb soldering processes have a peak reflow temperature of 220°C. At this temperature range, the SnAgCu BGA solder balls do not properly melt and wet to the soldering surfaces. As a result, reliability and assembly yields can be compromised.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board. Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

Table 7-1 and Figure 7-3 provide guidelines for profiling Pb-free solder reflow for package sizes up to 45 mm x 45 mm. Table 7-2 provides guidelines for package sizes greater than 45 mm x 45 mm and up to 55 mm x 55 mm. Table 7-3 provides guidelines for packages sizes greater than 55 mm x 55 mm. In general, a gradual, linear ramp into a spike has been shown by various sources to be the optimal reflow profile for Pb-free solders (Figure 7-3). This profile has been shown to yield better wetting and less thermal shock than conventional ramp-soak-spike profile for the Sn/Pb system. SnAgCu alloy reaches full liquidus temperature at 235°C. When profiling, identify the possible locations of the coldest solder joints and ensure that those solder joints reach a minimum peak temperature of 235°C for at least 10 seconds. Reflowing at high peak temperatures of 260°C and above can damage the heat sensitive components and cause the board to warp. Users should reference the latest IPC/JEDEC J-STD-020 standard for the allowable peak temperature on the component body. The allowable peak temperature on the component body is dependent on the size of the component. Refer to Table 7-4 for peak package reflow body temperature information. In any case, use a reflow profile with the lowest peak temperature possible.

Table 7-1: **Pb-Free Reflow Soldering Guidelines for Package Sizes Up to 45 mm x 45 mm**

Reflow Profile	Convection, IR/Convection
Preheat ramp-up rate 30°–150°C	2°C/s maximum 1°C/s maximum for lidless packages with stiffener ring
Preheat temperature soak time 150°–200°C	60–120 seconds
Temperature maintained above 217°C	60–150 seconds (60–90 seconds typical)
Time within 5°C of actual peak temperature	30 seconds maximum
Peak temperature (lead/ball)	230°C—245°C typical (depends on solder paste, board size, component mixture)
Maximum peak temperature (body)	240°C—250°C, package body size dependent (see specific device data sheets [Ref 3])
Ramp-down rate	2°C/s maximum
Time 25°C to peak temperature	3.5 minutes minimum, 5.0 minutes typical, 8 minutes maximum

Table 7-2: **Pb-Free Reflow Soldering Guidelines for Package Sizes Greater than 45 mm x 45 mm and Up to 55 mm x 55 mm**

Reflow Profile	Convection, IR/Convection
Preheat ramp-up rate 30°–150°C	0.5°C/s–1.5°C/s
Preheat temperature soak time 150°–190°C	65–70 seconds
Temperature maintained above 217°C	50–60 seconds
Maximum peak temperature (body)	234°C—238°C (see specific device data sheets [Ref 3])
Ramp-down rate 240°–125°C	1°C/s – 2°C/s

Table 7-3: **Pb-Free Reflow Soldering Guidelines for Package Sizes Greater than 55 mm x 55 mm**

Reflow Profile	Convection, IR/Convection
Preheat ramp-up rate 30°–150°C	0.5°C/s–1.5°C/s
Preheat temperature soak time 150°–190°C	76–81 seconds
Temperature maintained above 217°C	77–93 seconds
Maximum peak temperature (body)	231°C—240°C (see specific device data sheets [Ref 3])
Ramp-down rate 240°–185°C	0.7°C/s – 0.8°C/s
Ramp-down rate 185°–125°C	1.6°C/s – 1.75°C/s

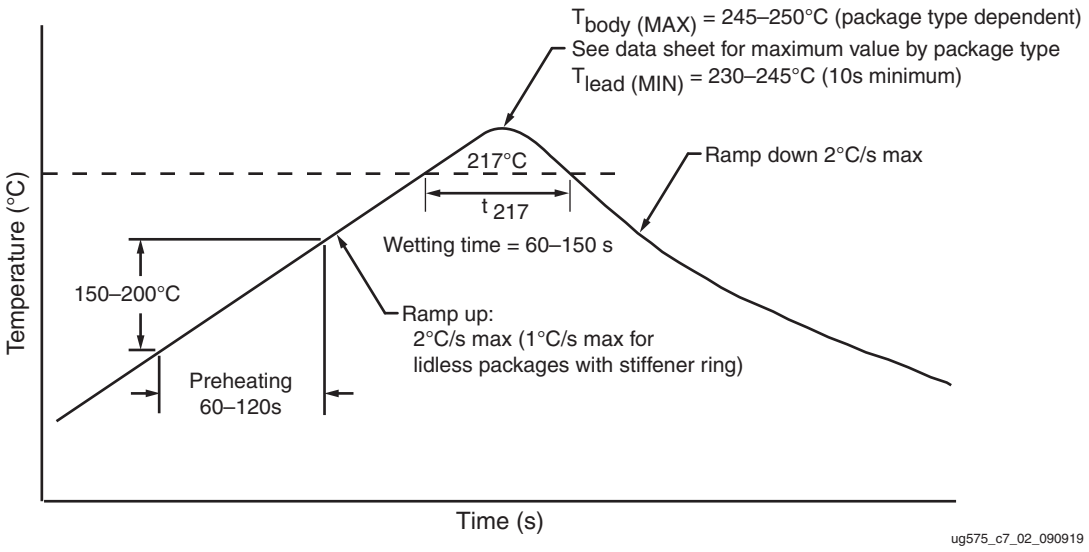

Figure 7-3: **Typical Conditions for Pb-Free Reflow Soldering**

Table 7-4: **Peak Package Reflow Body Temperature for Xilinx Packages (Based on J-STD-020 Standard)**

Package	Product Category	Peak Package Reflow Body Temperature[(1)]	JEDEC Moisture Sensitivity Level (MSL)

Table 7-4: **Peak Package Reflow Body Temperature for Xilinx Packages (Based on J-STD-020 Standard) *(Cont'd)***

Package	Product Category	Peak Package Reflow Body Temperature[1]	JEDEC Moisture Sensitivity Level (MSL)
FSVH1924 FSGD2104, FIGD2104, FSVH2104 FSGA2577 FSVH2892 FSVA3824, FSVB3824	All	Mass reflow: 240°C Dry rework: 260°C	4
RBA676, RFA1156, RLD1517, RLF1924 FFRB676, SFRB784 FFRA1156, FFRC1517, FFRE1517 FLRA2104, FLRB2104, FLRC2104	XQ[2]	Mass reflow: 225°C Dry rework: 235°C	4

Notes:

1. See the specific *UltraScale and UltraScale+ device data sheets* [Ref 3] for the most up-to-date specifications.
2. For devices with the Pb-free signifier in the package name (labeled as Q vs. V) use the temperatures and MSL listed for the XQ product category.

For sophisticated boards with a substantial mix of large and small components, it is critical to minimize the ΔT across the board (<10°C) to minimize board warpage and thus, attain higher assembly yields. Minimizing the ΔT is accomplished by using a slower rate in the warm-up and preheating stages.

It is also important to minimize the temperature gradient on the component, between top surface and bottom side, especially during the cooling down phase. The key is to optimize cooling while maintaining a minimal temperature differential between the top surface of the package and the solder joint area. The temperature differential between the top surface of the component and the solder balls should be maintained at less than 7°C during the critical region of the cooling phase of the reflow process. This critical region is in the part of the cooling phase where the balls are not completely solidified to the board yet, usually between the 200°C–217°C range. To efficiently cool the parts, divide the cooling section into multiple zones, with each zone operating at different temperatures.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board, as shown in Figure 7-4 and Figure 7-5 (thermocouple pictures). Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

Post Reflow/Cleaning/Washing

Many PCB assembly subcontractors use a no-clean process in which no post-assembly washing is required. Although a no-clean process is recommended, if cleaning is required, Xilinx recommends a water-soluble paste and a washer using a deionized-water. Baking after the water wash is recommended to prevent fluid accumulation.

Cleaning solutions or solvents are not recommended because some solutions contain chemicals that can compromise the lid adhesive, thermal compound, or components inside the package.

Conformal Coating

Xilinx does not have information regarding the reliability of flip-chip BGA packages on a board after exposure to any specific conformal coating process. Therefore, any process using conformal coating should be qualified for the specific use case to cover the materials and process steps.

Ruggedized XQ packages are designed to support conformal coating, with vented lids that ensure proper cleaning can occur after the etching process and prior to conformal coating.

RECOMMENDED: *When a conformal coating is required, Parylene-based material should be used to avoid potential risk of weakening the lid or stiffener ring adhesive used in Xilinx packages.*

Strain Gauge Measurement

Strain gauge measurements are recommended to be done at each process step that has the potential to cause excessive board flexing leading to solder joint cracking. Assembly processes where strain gauge measurements are recommended include:

- PCB Router (during PCB loading/unloading into fixture and during the routing process)
- PTH solder assembly during top-catch loading/unloading
- Press fit assembly during press base and tooling loading/unloading and during machine pressing process
- DIMM memory (during PCB loading/unloading and during insertion/removal of DIMM)
- Heat-sink assembly process (during PCB loading/unloading and during entire screw assembly process)
- X-ray fixture (during PCBA loading/unloading)

Strain gauge measurements should be in the range of ±500 µstrain. Dye and pry analysis is required to confirm if the measured strain causes solder joint cracking. It is recommended to conduct dye and pry analysis for any strain reading greater than 500 µstrain.

To reduce the affects of strain on a device, edge bonding can be used and is recommended for larger packages. See Edge Bonding Guidelines for implementation details.

Solder Paste

Solder paste consists of solder alloy and a flux system. A typical solder paste composition by volume is split between about 50% alloy and 50% flux. The metal load mass (solder alloy powder) is around 90%, with the remaining 10% mass a flux system. The primary purpose of the flux system is to remove the contaminations from the solder joints during the soldering process. The capability of removing contaminations is determined by the activation level of the type of solder paste. The preferred solder paste metal alloy has a lead-free composition (SnAgCu where Ag is 3–4% and Cu is 0.5–1%). A *no-clean* solder paste is preferred to eliminate any risk of improper cleaning that could leave active residue beneath the device and other BTC components. The paste must be suitable for printing the solder stencil aperture dimensions. Type 4 paste is recommended for better paste release performance. When using a solder paste, you must adhere to the handling recommendations of the paste manufacturer.

Component Placement

IMPORTANT: *The following component placement guidelines apply to all package types included in this guide (lidded, lidless, bare-die, etc.).*

Xilinx device packages must be placed accurately according to their geometry outline. Positioning packages manually via hand mounting is not recommended.

Typical component placement accuracies of ±50 µm can be achieved using standard pick and placement machine equipment with vision system. The PCB and the components are optically checked and measured and the components are placed on the PCB in specific programmed positions based on the PCB CAD information. The pick and placement machine vision system detects the fiducials on the PCB immediately prior to mounting the FPGA. Recognition of the packages is performed by the vision system, to ensure correct centering of the FPGA placement on the PCB pad array.

BGA packages with solder balls can self-align during the reflow process because of the solder high surface tension that enables the pulling and centering of the device, and where a slight offset of the placement is still allowed. For guidance, the maximum tolerable offset of device placement is around 30% of the pad diameter on the PCB for typical non-solder mask defined pads. This means that for device packages the solder ball to PCB pad misalignment must be better than 150 µm to assure a robust mounting process. Generally, this is achievable using a wide range of modern pick and placement systems. The following setup conditions are important for the pick and placement systems:

- The pick and placement nozzle type should be sized to the dimensions of the Xilinx device. The nozzle needs to firmly hold the device package during the pick and placement stage. The appropriate nozzle type for the device package can be chosen from the manual provided by the pick and placement equipment company.
- The ball recognition capabilities of the placement system should be used and package outline centering should be avoided. This eliminates the solder ball to package edge tolerances of the package. Refer to the specific package outline drawing for details.
- To ensure the proper identification of the device package by the vision system, a suitable lighting system and the correct choice of the features of the measuring method are essential. The most suitable settings can be chosen from the manual provided by the pick and placement equipments company.
- To avoid solder bridging or solder smear, ensure the proper placement force of the device package during placement on the PCB. Excessive placement force can lead to excess solder paste and cause solder bridging. However, a slight placement force can lead to insufficient solder paste contact between the device package solder balls and the solder paste, causing solder defects including open solder joints, badly centered packages, or even head-in-pillow (HIP) defects.

Recommended PCB Design Rules for BGA Packages

BGA Packages

Xilinx provides the diameter of a land pad on the package side. This information is required prior to the start of the board layout so the board pads can be designed to match the component-side land geometry. The typical values of these land pads are described in Figure 8-1 and summarized in Table 8-1. PCB pad size is based on the BGA ball size. Typical requirements for the PCB pad size are 80-120% of ball size however, given a large package size and to prevent solder bridging, a pad size closer to 80% of the ball size is recommended. For Xilinx BGA packages, non-solder mask defined (NSMD) pads on the board are suggested to allow a clearance between the land metal (diameter L) and the solder mask opening (diameter M) as shown in Figure 8-1.

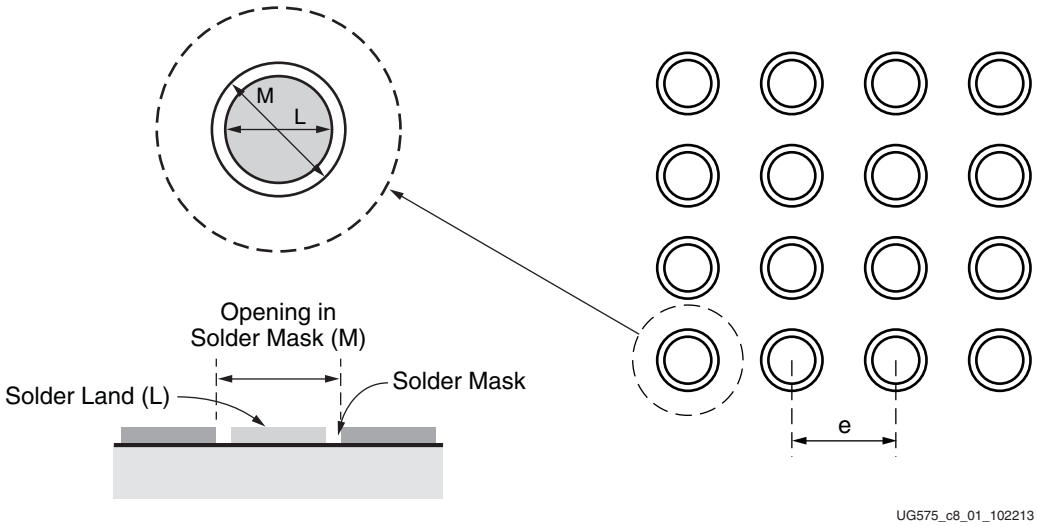

Figure 8-1: **Suggested Board Layout of Soldered Pads for BGA Packages**

An example of an NSMD PCB pad solder joint is shown in Figure 8-2. The space between the NSMD pad and the solder mask, as well as the actual signal trace widths, depends on the capability of the PCB vendor. The cost of the PCB is higher when the line width and spaces are smaller.

RECOMMENDED: *Xilinx recommends not mixing PCB pad isolated via-in-pad plated over (VIPPO) and non-VIPPO design styles because they can cause hot tear defects that are related to localized Z-direction thermal expansion coefficient mismatch between VIPPO and non-VIPPO vias. A VIPPO via expands less than a non-VIPPO via.*

RECOMMENDED: *For packages that include land-side capacitors (LSCs), such as the FSVA3824 or FSVB3824, the region underneath the LSCs should be covered by solder mask.*

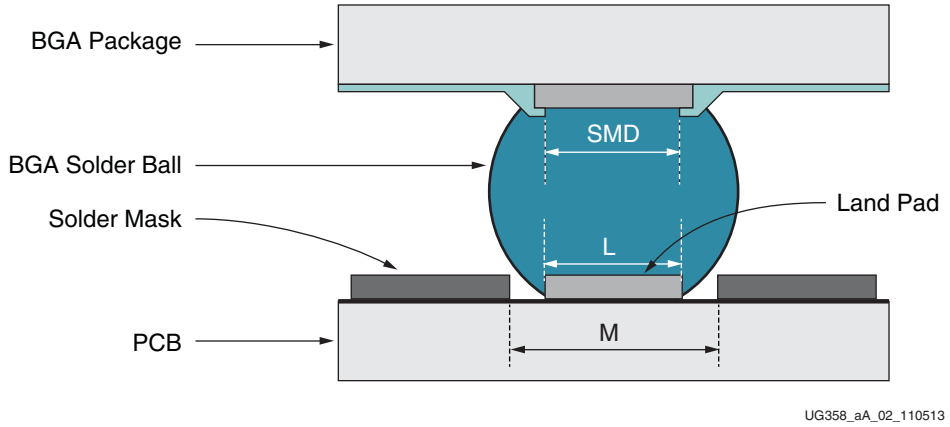

Figure 8-2: **Example of an NSMD PCB Pad Solder Joint**

Table 8-1: **BGA Package Design Rules**

Flip-Chip BGA Packages	1.0 mm Pitch	0.8 mm Pitch
Design Rule	**Dimensions in mm (mils)**	
Package land pad opening (SMD)	0.53 mm (20.9 mils)	0.40 mm (15.7 mils)
Maximum PCB solder land (L) diameter	0.50 mm (19.7 mils)	0.40 mm (15.7 mils)
Opening in PCB solder mask (M) diameter	0.65 mm (25.6 mils)	0.50 mm (19.7 mils)
Solder ball land pitch (e)	1.00 mm (39.4 mils)	0.80 mm (31.5 mils)

Notes:
1. Controlling dimension in mm.

Stencil

Solder paste is applied to PCB metal pads by screen printing. The volume of the printed solder paste is determined by the stencil aperture and the stencil thickness. In most cases, the thickness of a stencil must be matched to the needs of all components on the PCB. Stencil apertures should be a circular shape. To ensure a uniform and high-solder paste transfer to the PCB, laser-cut (mostly made from stainless steel) with nickel blanking is preferred.

Uniform Stencil Aperture Design

A uniform stencil aperture opening of 19.7 mils round is recommended for packages smaller than 45 mm x 45 mm, matching the PCB pad size for a 1 mm pitch package.

Bull's Eye Stencil Recommendation

Another option is to use a *Bull's Eye* stencil aperture, where the board land-pad diameter increases from the center of the device outward with variable stencil opening that depends on the warpage as a function of thermal expansion and mechanical attachment. This can vary depending on the PCB. The bull's eye offers a *capture* margin, because with an increased opening size with respect to the outer BGA balls, more solder paste is printed. A recommended stencil design for the FSVA3824 package is shown in Figure 8-3. Similar stencil designs are recommended for packages larger than 45mm x 45mm. The final stencil design should be based on an evaluation of your board design.

RECOMMENDED: *Xilinx recommends using a 5 mil thick stencil.*

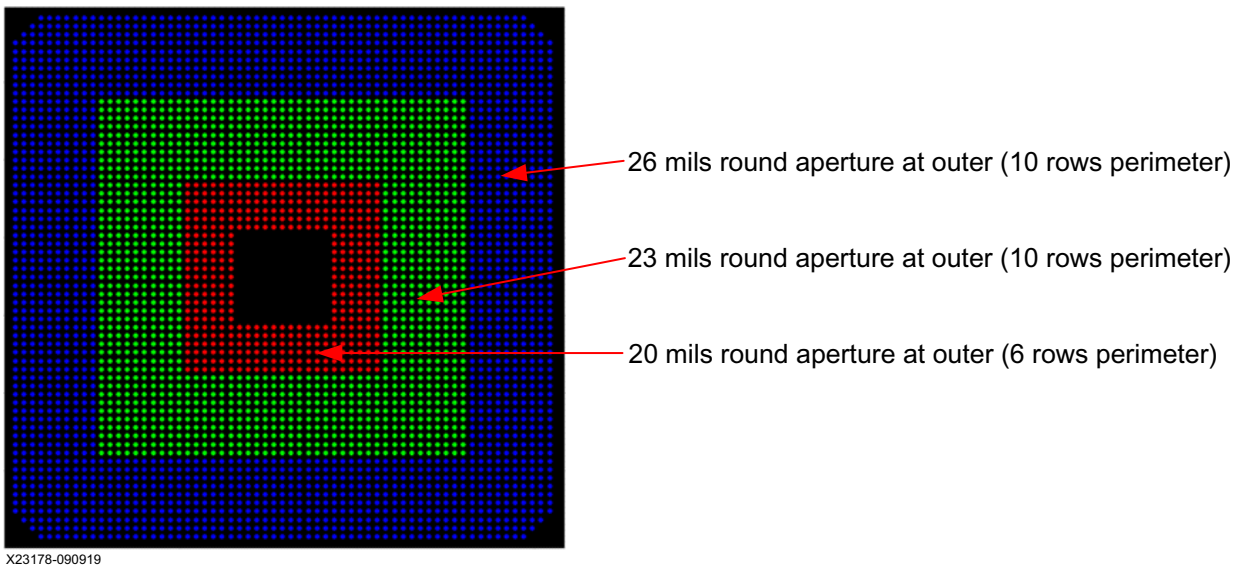

Figure 8-3: **Bull's Eye Stencil Aperture**

Edge Bonding Guidelines

Summary

The edge bonding technique uses high-adhesion adhesives dispensed along the periphery of a component, as shown in Figure 9-1. Xilinx recommends edge bonding larger packages (55 mm x 55 mm or larger) for increased mechanical reliability.

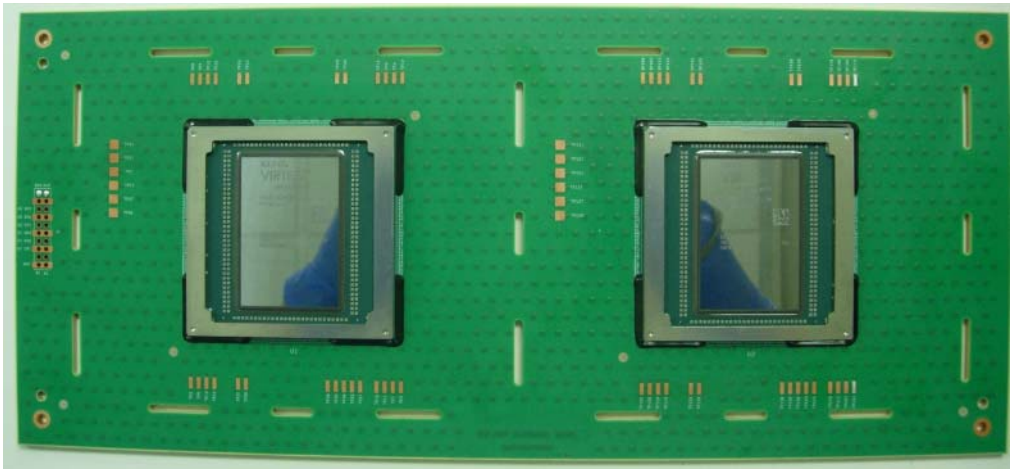

Figure 9-1: **Edge Bonded BGA Packages**

Edge Bonding Implementation

Edge bonding is the dispensing of an epoxy material around the periphery of the package after board mount. Xilinx requires the use of the Zymet UA-2605-B edge-bonding material.

Edge bonding is not intended to under fill the package or contact the solder balls. This technique allows for component rework and improves the robustness of the mounted component by controlling the expansion and warpage of the board during normal operating conditions

To place the adhesive while using an in-line soldering robot, Xilinx recommends the parameters shown in Table 9-1.

Table 9-1: **Process Parameters for Edge Bonding**

Process Parameter	Range Specification
Needle size	25—20 gauge
Needle height	Above the device edge midpoint, or 0 to 1.5 mm below the device top surface
Needle edge spacing	Half to three quarters of the needle outer diameter (D) Dispense needle speed	0.1 to 200 mm/second (typical 15 mm/sec)
Valve pressure	20 to 60 psi (typical 25 psi)

The adhesive is dispensed along the perimeter of the assembled component at a width of 3 mm and a height of 50% to 90% the substrate height, leaving a small section at the center of each edge unbonded, as illustrated in Figure 9-2. This is to ensure that there is an outlet for any expansion of the air during processing. Xilinx recommends centering the opening on each side with a width of 25–30% the length of the package substrate. The exact locations and size of the openings can be varied depending on the design and rework.

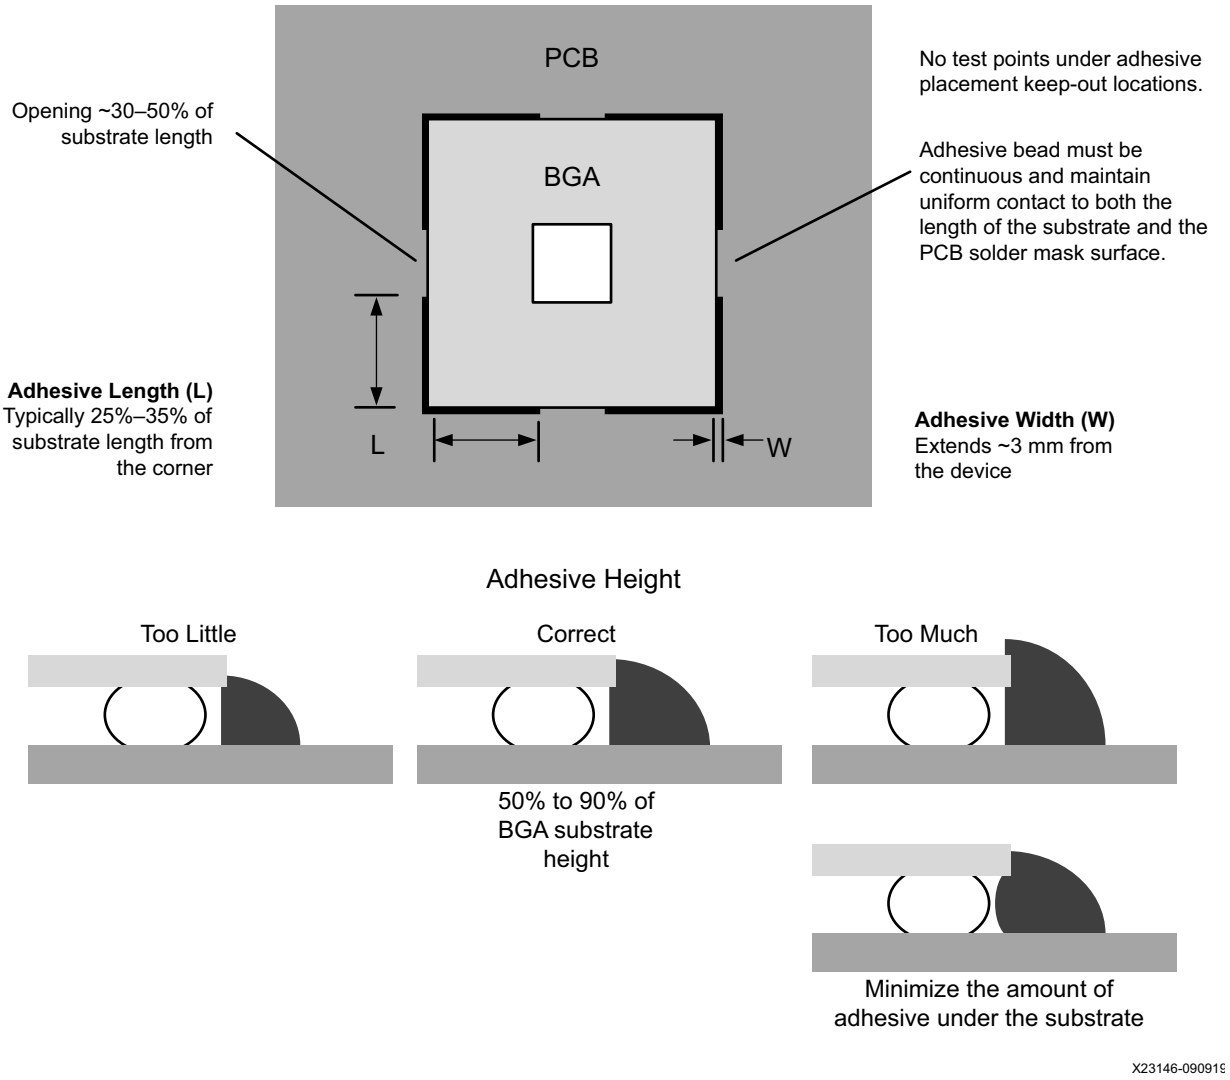

Figure 9-2: **Edge Bonding Adhesive Placement Parameters**

RECOMMENDED: *Curing conditions are 155°C for 10 minutes.*

Component Clearance Surrounding Edge Bond

An adjacent component clearance surrounding the Xilinx device is necessary to have the 30° to 45° angle required by the for the edge bond dispenser to dispense the edge bond adhesive material. The surrounding component height and distance from the device is validated based on each unique product design layout.

Edge Bond Removal

Edge bond material can be removed by heating to 170–180°C, and scraping using a stiff probe made of stable organic material such as a non-resinous wood or Teflon. Use a hot air blower on the edge bond area and slowly remove the edge bond adhesive from side to side. Do not use force to remove the edge bond adhesive. Excess adhesive on the PCB can be removed using a chisel-tip soldering iron, with sufficient precautions to limit damage to the PCB surface.

Thermal Specifications

Introduction

UltraScale and UltraScale+ devices are offered exclusively in thermally efficient flip-chip BGA packages. These flip-chip packages range in pin-count from the smaller 23 x 23 mm SFVA784 to the 55 x 55 mm FLGA2892. This suite of packages is used to address the various power requirements of the UltraScale and UltraScale+ devices. UltraScale devices are implemented in the 20 nm process technology. UltraScale+ devices are implemented in the 16 nm process technology.

Unlike features in an ASIC or a microprocessor, the combination of FPGA features used in a user application is not known to the component supplier. Therefore, it remains a challenge for Xilinx to predict the power requirements of a given FPGA when it leaves the factory. Accurate estimates are obtained when the board design takes shape. For this purpose, Xilinx offers and supports a suite of integrated device power analysis tools to help users quickly and accurately estimate their design power requirements. UltraScale and UltraScale+ devices are supported similarly to previous FPGA products. The uncertainty of design power requirements makes it difficult to apply canned thermal solutions to fit all users. Therefore, Xilinx devices do not come with preset thermal solutions. Your design operating conditions dictate the appropriate solution.

Thermal Resistance Data

Table 10-1 shows the thermal resistance data for UltraScale and UltraScale+ devices (grouped in the packages offered). The data includes junction-to-ambient in still air, junction-to-case, and junction-to-board data based on standard JEDEC four-layer measurements.

IMPORTANT: *The data in Table 10-1 is for device/package comparison purposes only. Attempts to recreate this data are only valid using the transient 2-phase measurement techniques outlined in JESD51-14.*

TIP: *The thermal data query for all available devices by package is available on the Xilinx website:* www.xilinx.com/cgi-bin/thermal/thermal.pl.

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC, and the third digit in the package name is Q (for example: FFQA1156). Refer to the XC version of these packages for their thermal resistance data and thermal models.*

Notes:

1. All $\theta_{JA\text{-}Effective}$ values assume no heat sink and include thermal dissipation through a standard JEDEC four-layer board. The Xilinx power estimation tools (Vivado® Power Analysis and Xilinx Power Estimator), which require detailed board dimensions and layer counts, are useful for deriving more precise $\theta_{JA\text{-}Effective}$ values.
2. This data is for device/package comparison purposes only. Attempts to recreate this data are only valid using the transient 2-phase measurement techniques outlined in JESD51-14.

Support for Thermal Models

Table 10-1 provides the traditional thermal resistance data for UltraScale and UltraScale+ devices. These resistances are measured using a prescribed JEDEC standard that might not necessarily reflect your actual board conditions and environment. The quoted θ_{JA} and θ_{JC} numbers are environmentally dependent, and JEDEC has traditionally recommended that these be used with that awareness. For more accurate junction temperature prediction, these might not be enough, and a system-level thermal simulation might be required.

Though Xilinx continues to support these figure of merit data, for UltraScale and UltraScale+ devices, boundary conditions independent thermal resistor network (Delphi) models are offered for all UltraScale and UltraScale+ devices. These compact models seek to capture the thermal behavior of the packages more accurately at predetermined critical points (junction, case, top, leads, and so on) with the reduced set of nodes as illustrated in Figure 10-1.

Unlike a full 3D model, these are computationally efficient and work well in an integrated system simulation environment. Delphi models are available for download on the Xilinx website (under the Device Model tab).

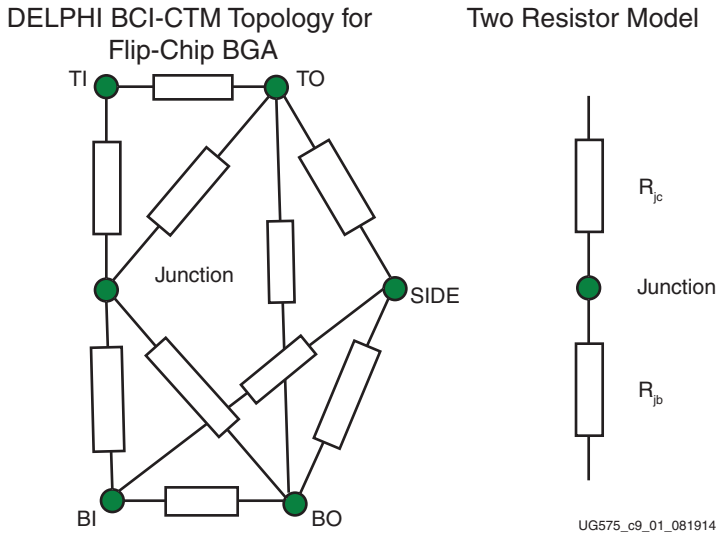

Figure 10-1: **Thermal Model Topologies**

RECOMMENDED: *Xilinx recommends use of the Delphi thermal model during thermal modeling of a package. The Delphi thermal model includes consideration of the thermal interface material parameters and the manufacture variation on the thermal solution. Examples of manufacture variations include the tolerance in airflow from a fan, the tolerance on performance of the heat pipe and vapor chamber, and the manufacture variation of the attachment of fins to the heat-sink base and the flatness of the surface.*

Thermal Management Strategy

Introduction

As described in this section, Xilinx relies on a multi-pronged approach to consuming less power and dissipating heat for systems using UltraScale™ and UltraScale+™ devices.

Flip-Chip Packages

UltraScale and UltraScale+ devices are offered in flip-chip BGA packages, which present a low thermal path. With the exception of the bare-die packages, the flip-chip BGA packages incorporate a heat spreader with an additional thermal interface material (TIM), as shown in Figure 11-1.

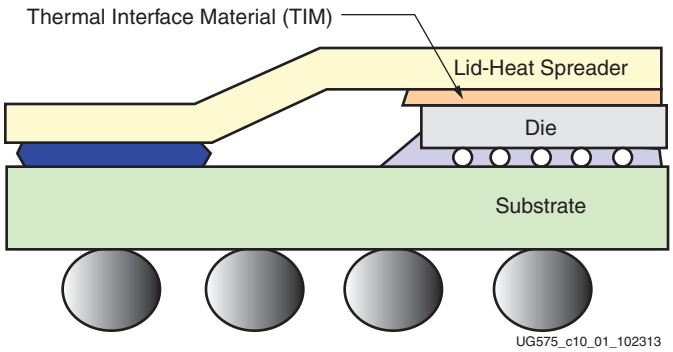

Figure 11-1: **Heat Spreader with Thermal Interface Material**

Materials with better thermal conductivity and consistent process deliver low thermal resistance to the heat spreader.

A parallel effort to ensure optimized package electrical return paths produces the added benefit of enhanced power and ground plane arrangement in the packages. A boost in copper density on the planes improves the overall thermal conductivity through the laminate. In addition, the extra dense and distributed via fields in the package increase the vertical thermal conductivity.

System Level Heat Sink Solutions

To complete a comprehensive thermal management strategy, an overall thermal budget that includes custom or OEM heat-sink solutions depends on the physical and mechanical constraints of the system. A heat-sink solution, managed by the system-level designer, should be tailored to the design and specific system constraints. This includes understanding the inherent device capabilities for delivering heat to the surface.

By considering the system's physical, mechanical, and environmental constraints, the overall thermal budget is maintained and does not exceed the device's maximum operating temperature. The heat sink is an integral part of the thermal management solution to maintain a safe operating temperature. As a result, the system-level designer must be aware of the following:

- For lidless packages, the nominal stiffener height can be different from the height of the die. Therefore, the heat sink must have an island to contact the die.
- Especially for lidless packages, Xilinx advises against direct use of the θ_{JC} parameters (see Table 10-1) to determine the thermal performance of the device in your application. The calculation of these parameters are done in accordance with the JEDEC standard JESD51 where system parameters differ greatly from most applications. Instead, run thermal simulations of the system in worst-case environmental conditions using Delphi thermal models, which more accurately represent the device thermal performance under all boundary conditions.
- Consider the mechanical specifications of the package as well as the selection of the thermal interface between the die and the thermal management solution to ensure the lowest thermal contact resistance.
- The total thermal contact of the thermal interface material is determined based on parameters from the thermal interface supplier's data sheet.
- See the applied pressure recommendation on page 449. Lower pressure runs the risk of poor thermal contact and higher pressure runs the risk of damaging the device; therefore, strict control of pressure is required.
- Consider all uncertainties in thermal modeling, including manufacturing variations from the thermal solutions (for example, fan airflow tolerance, heat pipe or vapor chamber performance tolerance, variation of the attachment of fins to heat sink base, and surface flatness).

Thermal Interface Material

When installing heat sinks for UltraScale or UltraScale+ devices, a suitable thermal interface material must be used. This thermal material significantly aids the transfer of heat from the component to the heat sink.

For bare-die flip-chip BGAs, the surface of the silicon contacts the heat sink. For lidded flip-chip BGAs, the lid contacts the heat sink. The surface size of the bare-die flip-chip BGA and lidded flip-chip BGAs are different. Xilinx recommends a different type of thermal material for long-term use with each type of flip-chip BGAs package.

Thermal interface material is needed because even the largest heat sink and fan cannot effectively cool an UltraScale or UltraScale+ device unless there is good physical contact between the base of the heat sink and the top of the UltraScale or UltraScale+ device. The surfaces of both the heat sink and the UltraScale or UltraScale+ device silicon are not absolutely smooth. This surface roughness is observed when examined at a microscopic level. Because surface roughness reduces the effective contact area, attaching a heat sink without a thermal interface material is not sufficient due to inadequate surface contact.

A thermal interface material such as phase-change material, thermal grease, or thermal pads fills these gaps and allows effective transference of heat between the UltraScale or UltraScale+ device die and the heat sink.

The selection of the thermal interface material between the package and the thermal management solution is critical to ensure the lowest thermal contact resistance. Therefore, the following parameters must be considered.

1. The flatness of the lid and the flatness of the contact surface of the thermal solution.
2. The applied pressure of the thermal solution on the package, which must be within the allowable maximum pressure that can be applied on the package.
3. The total thermal contact of the thermal interface material. This value is determined based on the parameters in step 1 and step 2, which are published in the data sheet of the thermal interface supplier.

Types of TIM

There are many type of TIM available for sale. The most commonly used thermal interface materials are listed.

- Thermal grease
- Thermal pads
- Phase-change material
- Thermal paste
- Thermal adhesives
- Thermal tape

Guidelines for Thermal Interface Materials

Five factors affect the choice, use, and performance of the interface material used between the processor and the heat sink:

- Thermal Conductivity of the Material
- Electrical Conductivity of the Material
- Spreading Characteristics of the Material
- Long-Term Stability and Reliability of the Material
- Ease of Application
- Applied Pressure from Heat Sink to the Package via Thermal Interface Materials

Thermal Conductivity of the Material

Thermal conductivity is the quantified ability of any material to transfer heat. The thermal conductivity of the interface material has a significant impact on its thermal performance. The higher the thermal conductivity, the more efficient the material is at transferring heat. Materials that have a lower thermal conductivity are less efficient at transferring heat, causing a higher temperature differential to exist across the interface. To overcome this less efficient heat transfer, a better cooling solution (typically, a more costly solution) must be used to achieve the desired heat dissipation.

Electrical Conductivity of the Material

Some metal-based TIM compounds are electrically conductive. Ceramic-based compounds are typically not electrically conductive. Manufacturers produce metal-based compounds with low-electrical conductivity, but some of these materials are not completely electrically inert. Metal-based thermal compounds are not hazardous to an UltraScale or UltraScale+ device die itself, but other elements on an UltraScale or UltraScale+ device or the motherboard can be at risk if they become contaminated by the compound. For this reason, Xilinx does not recommend the use of electrically conductive thermal interface material.

Spreading Characteristics of the Material

The spreading characteristics of the thermal interface material determines its ability, under the pressure of the mounted heat sink, to spread and fill in or eliminate the air gaps between the UltraScale or UltraScale+ device and the heat sink. Because air is a very poor thermal conductor, the more completely the interface material fills the gaps, the greater the heat transference.

Long-Term Stability and Reliability of the Material

The long-term stability and reliability of the thermal interface material is described as the ability to provide a sufficient thermal conductance even after an extended time or extensive. Low-quality compounds can harden or leak out over time (the pump-out effect), leading to overheating or premature failure of the UltraScale or UltraScale+ device. High-quality compounds provide a stable and reliable thermal interface material throughout the lifetime of the device. Thermal greases with higher viscosities are typically more resistant to pump out effects on bare-die devices.

Ease of Application

A spreadable thermal grease requires the surface mount supplier to carefully use the appropriate amount of material. Too much or too little material can cause problems. The thermal pad is a fixed size and is therefore easier to apply in a consistent manner.

Applied Pressure from Heat Sink to the Package via Thermal Interface Materials

Measure applied pressure using a calibrated pressure sensor on multiple locations between the device and the heat sink assembly as shown in Figure 11-2.

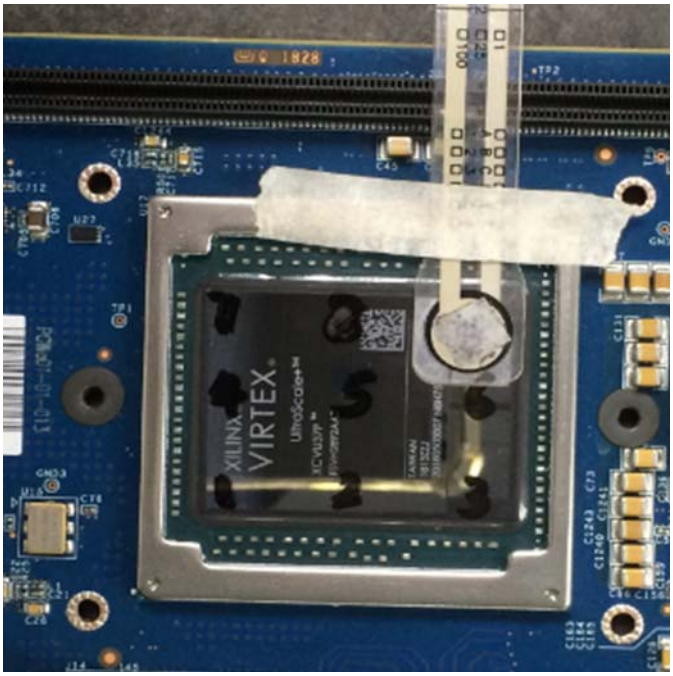

Figure 11-2: **Pressure Sensor**

RECOMMENDED: *Xilinx recommends that the applied pressure on the package be in the range of 20 to 50 psi for optimum performance of the thermal interface material (TIM) between the package and the heat sink. Thermocouples should not be present between the package and the heat sink, as their presence will degrade the thermal contact and result in incorrect thermal measurements. The best practice is to select the appropriate pressure (in the 20 to 50 psi range) for the optimum thermal contact performance between the package and the thermal system solution, and the mechanical integrity of the package (with the thermal solution to pass all mechanical stress and vibration qualification tests).*

TIP: *These recommendations and specifications are the same for both lidded and lidless devices.*

RECOMMENDED: *Xilinx recommends using dynamic mounting around the four corners of the device package. On the PCB, use a bracket clip as part of the heat sink attachment to provide mechanical package support. See Figure 11-3.*

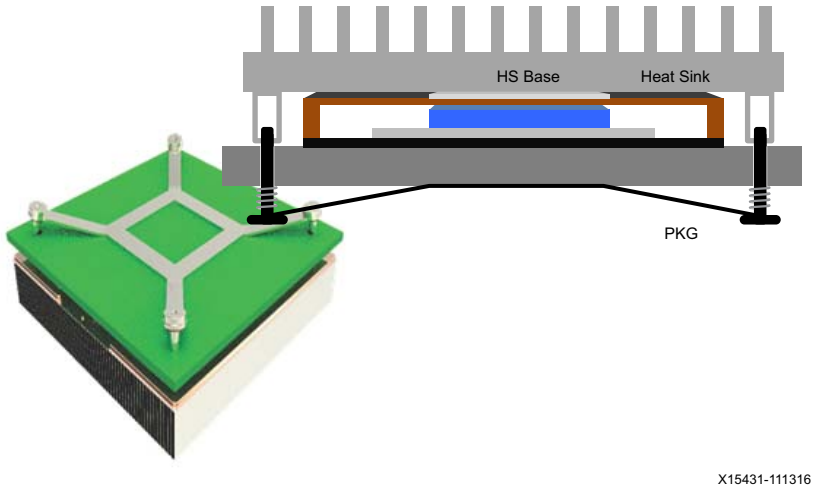

Figure 11-3: **Dynamic Mounting and Bracket Clips on Heat Sink Attachment**

Heat Sink Removal

When removing or reworking heat sinks, the phase-change material residue must be removed from the surface of the die. Laird Technologies, Inc. provides the following guidance for complete removal of the phase-change material from the component.

Instructions for Removal of Phase-change Material

1. Separate the Components
2. Scrape Away Thick Residue
3. Clean Remaining Residue with Solvent
4. Working with Laird Material

Separate the Components

At room temperature, if possible, use a back and forth twisting motion to break the bond between the phase-change thermal interface material and mated components (i.e., heat sink and FPGA). See Figure 11-4.

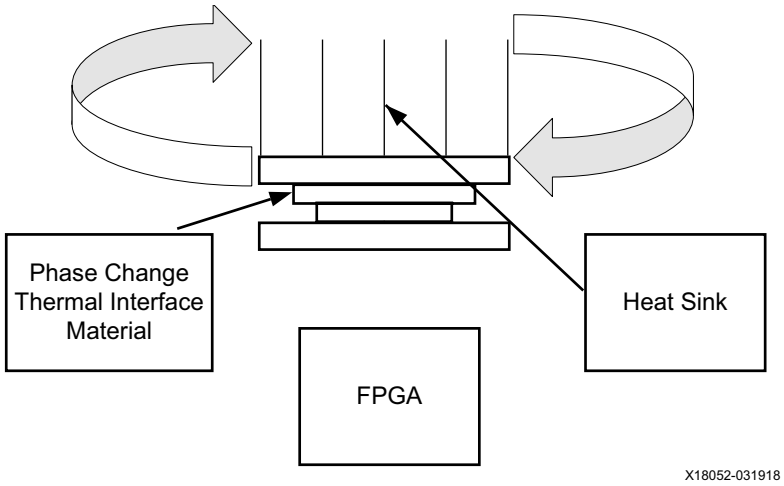

Figure 11-4: **Breaking the Bond between Thermal Interface Material and Mated Components**

For smaller components (typically 15 mm x 15 mm or less), the bond usually breaks free easily at room temperature. For larger components, in situations where minimal movement is available, or if using fragile components, heat the component (preferred) or heat sink to about 40°C–60°C before removal.

The guideline is 40°C–60°C, however, you might find that for your application, heating to 35°C is adequate. You might prefer to heat to 70°C which makes the phase-change thermal interface material very soft and the components can be easily separated.

Scrape Away Thick Residue

For a faster clean-up once components are separated, scrape away any large residual material amounts with a plastic spatula or a wooden tongue depressor. A clean dry rag can be used to wipe away excess material.

Clean Remaining Residue with Solvent

Using a clean cloth/wipe, wet it with your choice of solvent (see the following list) and wipe away any remaining residue.

- Toluene (easiest)
- Acetone (very good)
- Isoparaffinic hydrocarbon: Isopar, Soltrol (trade names) (very good)
- Isopropyl alcohol (OK)

Working with Laird Material

Safe handling, disposal, and first-aid measures for working with phase-change material are included in the Laird Technologies material safety data sheet (MSDS). Read the MSDS before using or handling. See the Laird Technologies, Inc. website, www.lairdtech.com.

Measurement Debug

When performing in-system thermal testing, to ensure accurate data and not incur damage to the device, do not place a thermocouple in between the device and the heat sink. On the extreme side, it might cause additional mechanical and/or thermal stress to the device, leading to damage. Even if damage does not occur, it often leads to a thicker and or uneven thermal interface material thickness, leading to a thermal performance difference from a system without a thermocouple. To obtain the device temperature, use the System Monitor as a non-invasive means to get accurate device measurements while debugging the system.

Heat Sink Guidelines for Bare-die Flip-Chip Packages

Heat Sink Attachments for Bare-die FB Packages

Heat sinks can be attached to the package in multiple ways. For heat to dissipate effectively, the advantages and disadvantages of each heat sink attachment method must be considered. Factors influencing the selection of the heat sink attachment method include the package type, contact area of the heat source, and the heat sink type.

Silicon and Decoupling Capacitors Height Consideration

When designing heat sink attachments for bare-die flip-chip BGA packages, the height of the die above the substrate and also the height of decoupling capacitors must be considered (Figure 12-1). This is to prevent electrical shorting between the heat sink (metal) and the decoupling capacitors.

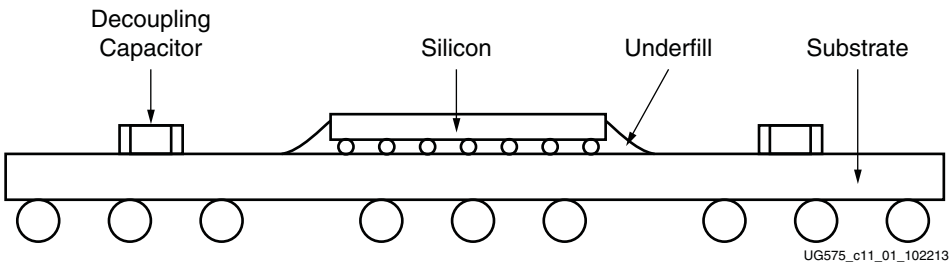

Figure 12-1: **Cross Section of Bare-die Flip-chip BGA**

Types of Heat Sink Attachments

There are six main methods for heat sink attachment. Table 12-1 lists their advantages and disadvantages.

- Thermal tape
- Thermally conductive adhesive or glue
- Wire form Z-clips
- Plastic clip-ons
- Threaded stand-offs (PEMs) and compression springs
- Push-pins and compression springs

Table 12-1: **Heat Sink Attachment Methods**

Attachment Method	Advantages	Disadvantages
Thermal tape	• Generally easy to attach and is inexpensive. • Lowest cost approach for aluminum heat sink attachment. • No additional space required on the PCB.	• The surfaces of the heat sink and the chip must be very clean to allow the tape to bond correctly. • Because of the small contact area, the tape might not provide sufficient bond strength. • Tape is a moderate to low thermal conductor that could affect the thermal performance.
Thermally conductive adhesive or glue	• Outstanding mechanical adhesion. • Fairly inexpensive, costs a little more than tape. • No additional space required on the PCB.	• Adhesive application process is challenging and it is difficult to control the amount of adhesive to use. • Difficult to rework. • Because of the small contact area, the adhesive might not provide sufficient bond strength.
Wire form Z-clips	• It provides a strong and secure mechanical attachment. In environments that require shock and vibration testing, this type of strong mechanical attachment is necessary. • Easy to apply and remove. Does not cause the semiconductors to be destroyed (epoxy and occasionally tape can destroy the device). • It applies a preload onto the thermal interface material (TIM). Pre-loads actually improve thermal performance.	• Requires additional space on the PCB for anchor locations.

Table 12-1: **Heat Sink Attachment Methods *(Cont'd)***

Attachment Method	Advantages	Disadvantages
Plastic clip-ons	• Suitable for designs where space on the PCB is limited. • Easy to rework by allowing heat sinks to be easily removed and reapplied without damaging the PCB board. • Can provide a strong enough mechanical attachment to pass shock and vibration test.	• Needs a keep out area around the silicon devices to use the clip. • Caution is required when installing or removing clip-ons because localized stress can damage the solder balls or chip substrate.
Threaded stand-offs (PEMs) and compression springs	• Provides stable attachments to heat source and transfers load to the PCB, backing plate, or chassis. • Suitable for high mass heat sinks. • Allows for tight control over mounting force and load placed on chip and solder balls.	• Holes are required in the PCB taking valuable space that can be used for trace lines. • Tends to be expensive, especially since holes need to be drilled or predrilled onto the PCB board to use stand-offs.
Push-pins and compression springs	• Provides a stable attachment to a heat source and transfers load to the PCB. • Allows for tight control over mounting force and load placed on chip and solder balls.	• Requires additional space on the PCB for push-pin locations.

Heat Sink Attachment

Component Pick-up Tool Consideration

For pick-and-place machines to place bare-die flip-chip BGAs onto PCBs, Xilinx recommends using soft tips or suction cups for the nozzles. This prevents chipping, scratching, or even cracking of the bare die (Figure 12-2).

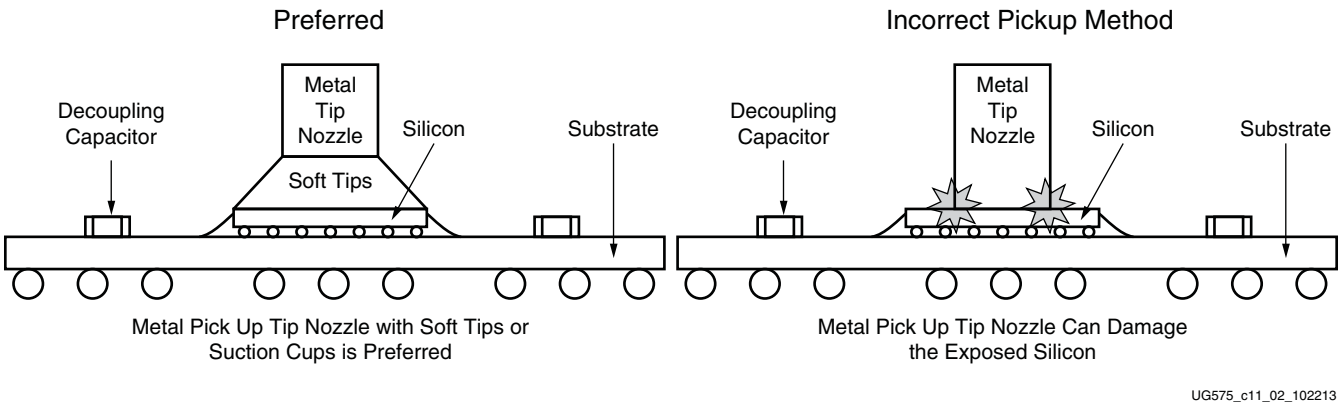

Figure 12-2: **Recommended Method For Using Pick-up Tools**

Heat Sink Attachment Process Considerations

After the component is placed onto the PCBs, when attaching a heat sink to the bare-die package, the factors in Table 12-2 must be carefully considered (see Figure 12-3).

Table 12-2: **Heat Sink Attachment Considerations**

Consideration(s)	Effect(s)	Recommendation(s)
In heat sink attach process, what factors can cause damage to the exposed die and passive capacitors?	• Uneven heat sink placement • Uneven TIM thickness • Uneven force applied when placing heat sink placement	• Even heat sink placement • Even TIM thickness • Even force applied when placing heat sink placement
Does the heat sink tilt or tip the post attachment?	Uneven heat sink placement will damage the silicon and can cause field failures.	• Careful handling not to contact the heat sink with the post attachment. • Use a fixture to hold the heat sink in place with post attachment until it is glued to the silicon.

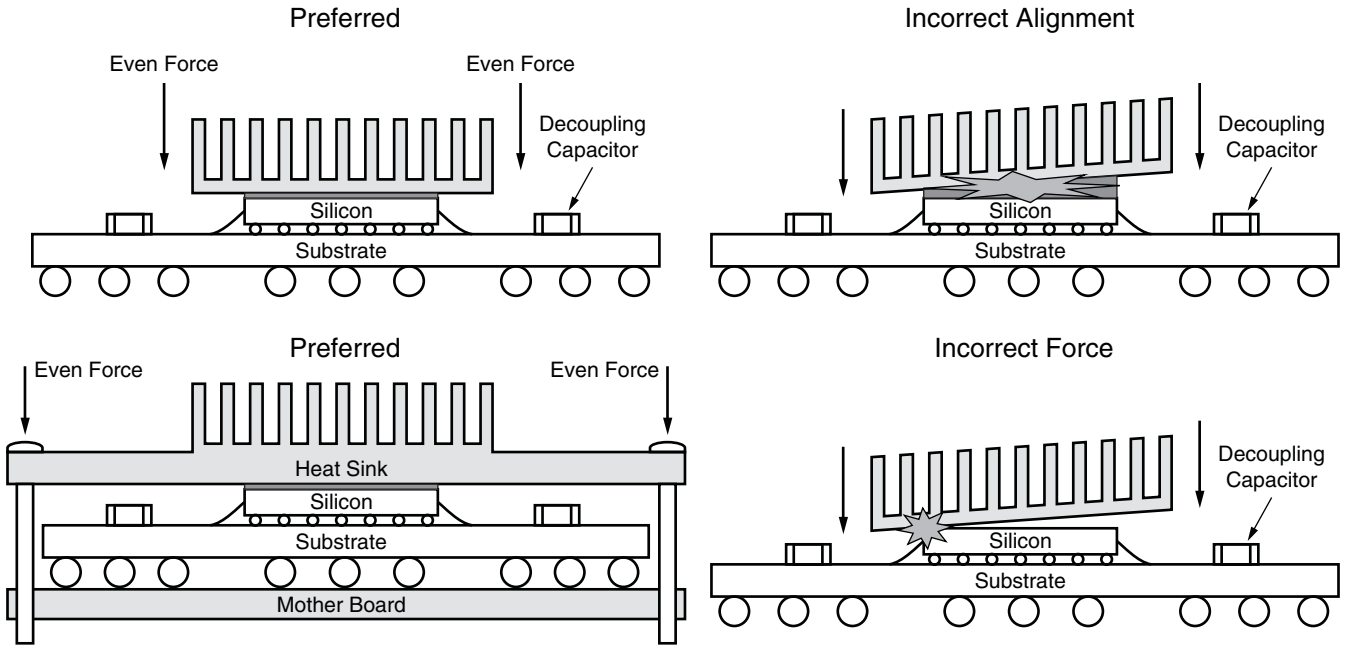

Figure 12-3: **Recommended Application of Heat Sink**

Standard Heat Sink Attach Process with Thermal Conductive Adhesive

Prior to attaching the heat sink, the UltraScale or UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermoset material (electrically non-conductive) is applied over the backside surface of silicon in a pattern using automated dispensing equipment. Automated dispensers are often used to provide a stable process speed at a relatively low cost. The optimum dispensing pattern needs to be determined by the SMT supplier.

   Note: Minimal volume coverage of the backside of the silicon can result in non-optimum heat transfer.
3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the adhesive spreads to cover the backside silicon. A force transducer is normally used to measure and limit the placement force.
4. The epoxy is cured with heat at a defined time.

   Note: The epoxy curing temperature and time is based on manufacturer's specifications.

Standard Heat Sink Attach Process with Thermal Adhesive Tape

Prior to attaching the heat sink, the UltraScale or UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermal adhesive tape cut to the size of the heat sink is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.
3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the thermal adhesive tape is glued to the backside of the silicon. A force transducer is normally used to measure and limit the placement force.
4. A uniform and constant pressure is applied uniformly over the heat sink and held for a defined time.

   Note: The thermal adhesive tape hold time is based on manufacturer's specifications.

Push-Pin and Shoulder Screw Heat Sink Attachment Process with Phase Change Material (PCM) Application

Prior to attaching the heat sink, the UltraScale or UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.

   Note: The jig or fixture needs to account for the push pin depth of the heat sink.

2. PCM tape, cut to the size of the heat sink, is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.

3. Using the push-pin tool, heat sinks are applied over the packages ensuring a pin locking action with the PCB holes. The compression load from springs applies the appropriate mounting pressure required for proper thermal interface material performance.

   Note: Heat sinks must not tilt during installation. This process cannot be automated due to the mechanical locking action which requires manual handling. The PCB drill hole tolerances need to be close enough to eliminate any issues concerning the heat sink attachment.

Chapter 13

Mechanical and Thermal Design Guidelines for Lidless Flip-chip Packages

Introduction

This chapter discusses the challenges of thermal management including reducing device thermal resistance and optimal power dissipation without an increase in junction temperature. The lidless UltraScale+ FPGA packages target the largest devices while allowing for cooler operation temperatures (up to 10°C) with the same power dissipation.

Precise mechanical design and component thermal management is vital for device and system performance. This document presents the unique thermal and mechanical design requirements for lidless devices.

Lidless Flip-Chip Packages

The Xilinx flip-chip BGA packages exhibit a low-resistance thermal path that adequately cools devices. These packages incorporate a heat spreader lid with additional thermal interface material (Figure 13-1).

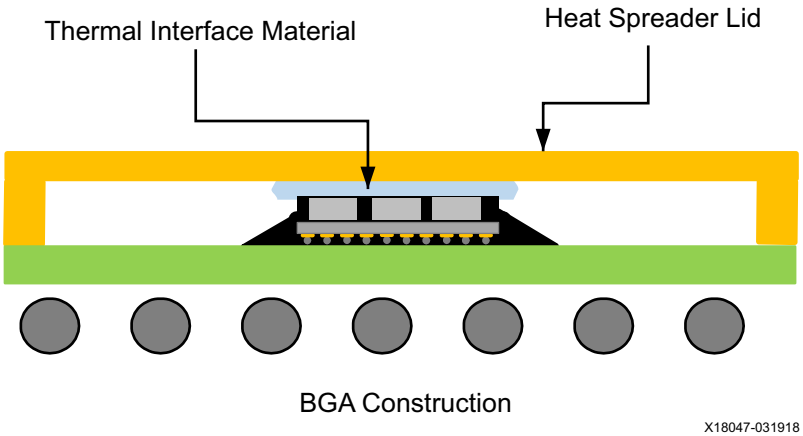

Figure 13-1: **Flip-Chip BGA Construction with Heat Spreader and Thermal Interface Material**

Materials with high thermal conductivity and consistent process applications deliver low thermal resistance up to the heat spreader. A parallel effort to ensure optimized package electrical return paths produces an enhanced power and ground plane arrangement in the package. A boost in copper density on the planes improves the overall thermal conductivity through the laminate. The extra density and distribution via fields in the package also increases the vertical thermal conductivity.

The lidless packages (Figure 13-2) offer the same package substrate design with electrical and board thermal conductivity similar to the flip-chip BGA packages. However, removing the lid (heat spreader) and the thermal interface material allows for direct contact between the external heat sink and the die. This further reduces the thermal resistance and exhibits improved thermal behaviors. The use of custom passive or active heat-sink designs is facilitated by incorporating two-phase (heat pipe, vapor chamber, or even liquid) cooling methods directly adjacent to the source of the dissipated heat on the die, which allows for a more efficient means of removing the heat from the device. Consequently, the device can operate at higher ambient temperatures while in area-constrained surroundings resulting in operational power advantages.

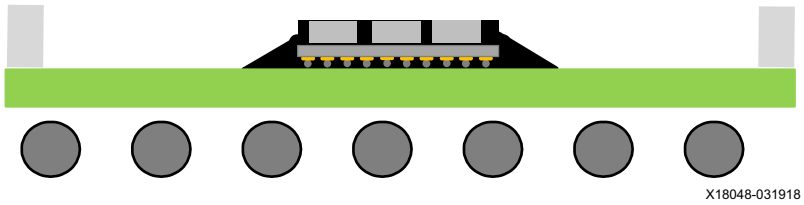

Figure 13-2: **Lidless Flip-Chip BGA Construction**

A unique feature of lidless packages is the addition of a stiffener ring around the periphery of the package substrate, providing additional package rigidity and helping to improve the overall package coplanarity (flatness). It also serves as a guide for the heat sink solution applied to the device. For examples, see Figure 4-45, Figure 4-46, and Figure 4-47.

In the lidless packages, capacitors can be placed in the area surrounding the die. Contact with electrically conductive materials must be avoided because the die-side capacitors, which are only slightly shorter than the die height, could be electrically conductive. Any thermal and mechanical solution higher than the die must not interfere with the package stiffener. Therefore, the thermal solution must have an island, see System Level Heat Sink Solutions in Chapter 11.

For further guidelines on mechanical and thermal designs of lidless packages, refer to XAPP1301: *Mechanical and Thermal Design Guidelines for Lidless Flip-Chip Packages Application Note* [Ref 19].

Xilinx Resources

For support resources such as Answers, Documentation, Downloads, and Forums, see Xilinx Support.

Solution Centers

See the Xilinx Solution Centers for support on devices, software tools, and intellectual property at all stages of the design cycle. Topics include design assistance, advisories, and troubleshooting tips.

Documentation Navigator and Design Hubs

Xilinx® Documentation Navigator provides access to Xilinx documents, videos, and support resources, which you can filter and search to find information. To open the Xilinx Documentation Navigator (DocNav):

- From the Vivado® IDE, select **Help > Documentation and Tutorials**.
- On Windows, select **Start > All Programs > Xilinx Design Tools > DocNav**.
- At the Linux command prompt, enter `docnav`.

Xilinx Design Hubs provide links to documentation organized by design tasks and other topics, which you can use to learn key concepts and address frequently asked questions. To access the Design Hubs:

- In the Xilinx Documentation Navigator, click the **Design Hubs View** tab.
- On the Xilinx website, see the Design Hubs page.

Note: For more information on Documentation Navigator, see the Documentation Navigator page on the Xilinx website.
