EVAL BOARD USER'S MANUAL

Introduction

This documentation package covers two NCL30083 LED driver implementations illustrating their use in an E26/E27 based A, PAR and BR LED lamps form factor. The Electronic Circuit Assembly (ECA) is designed to support

either an isolated flyback or non-isolated buck-boost configuration. The nominal total power is 10 W for either application. The selection is controlled through selective component population of the ECA.

Figure 1. NCL30083FLYGEVB – Flyback

Figure 2. NCL30083BB1GEVB – Buck-Boost

Table 1. DESIGN PARAMETER

Input Voltage	100 – 265 V ac	
Line Frequency	50 Hz/60 Hz	
Power Factor	> 0.7	
Safety (Designed to Meet)	IEC61347-2-13	EU
	UL8750	US
Optimized Output Voltage Range Flyback (NCL30083FLYGEVB) Buck Boost (NCL30083BB1GEVB)	9.6 – 22.1 V dc 30 – 60 V dc	
Output Current Flyback (NCL30083FLYGEVB) Buck Boost (NCL30083BB1GEVB)	500 mA dc 195 mA dc	±2 %
Output Ripple Flyback (NCL30083FLYGEVB) Buck Boost (NCL30083BB1GEVB)	200 mA P-P 50 mA P-P	
Efficiency Flyback (NCL30083FLYGEVB) Buck Boost (NCL30083BB1GEVB)	85% 90%	Typ.
Start Up Time	< 500 msec	Typ.

Demo Board Modifications

The board as shipped contains the NCL30083 to demonstrate the line step dimming function which allows the LEDs to be dimmed in 5 discrete steps by toggling the AC line (V_{in}) off momentarily. $C_{vccbulk}$ holds up V_{CC} while V_{in} toggles low switching to the next lower dim level. Since the timing is user controlled by switching on/off the light switch the timing window is very wide. Toggling the AC input in one second is typical. It may take more than 20 seconds of AC off to reset the IC, at which time when turned on again it return to the 100% state. By removing the $C_{vccbulk}$ the step dimming function is effectively disabled so the performance of the current control is just like the NCL300082. It is also possible with this board to replace the NCL30083 with an NCL30082 to evaluate the analog/dimming control.

The value of R_{sense} sets the final output current value in conjunction with R_{trim} which is for fine adjustment. The nature of the primary side loop control makes the current adjustment somewhat iterative because several circuit parameters affect the output current setting. It is relatively easy by changing R_{sense} to increase the output of the evaluation board as long as the output power limit is considered.

Since the NCL30082/3 has a wide V_{CC} range this allows one transformer/inductor design to a $> 2:1$ change in LED string forward voltage. If it is desired to reduce the output current, the output power is no longer the limit, but simply the level of the reflected voltage from the auxiliary winding which is monitored by the built in overvoltage protection of the V_{CC} pin. If a higher output voltage at lower current is required, the auxiliary winding turns ratio would have to be modified.

The input capacitor network uses a valley fill PFC to achieve a power factor of > 0.8 to easily meet ENERGY STAR® input power factor requirements. If compliance with EN61000-3-2 Class C is required, the input capacitor network can be easily modified and simplified to one capacitor, this is discussed in the appendix.

Constant Current Control Architecture Introduction

Figure 4 portrays the primary and secondary current of a fly-back converter in discontinuous conduction mode (DCM). Figure 3 shows the basic circuit of a fly-back converter.

Figure 3. Basic Flyback Converter Schematic

During the on-time of the MOSFET, the bulk voltage V_{bulk} is applied to the magnetizing and leakage inductors L_p and L_{leak} . The current ramps up.

When the MOSFET is turned-off, the inductor current first charges C_{lump} . The output diode is off until the voltage across L_p reverses and reaches:

$$N_{sp} (V_{out} + V_f)$$

The output diode current increase is limited by the leakage inductor. As a consequence, the secondary peak current is reduced:

$$I_{D,pk} < \frac{I_{L,pk}}{N_{sp}}$$

The diode current reaches its peak when the leakage inductor is reset. Thus, in order to accurately regulate the output current, we need to take into account the leakage inductor current. This is accomplished by sensing the clamping network current. Practically, a node of the clamp capacitor is connected to R_{sense} instead of the bulk voltage V_{bulk} . Then, by monitoring the voltage on the CS pin, we have an image of the primary current (red curve in Figure 4).

When the diode conducts, the secondary current decreases linearly from $I_{D,pk}$ to zero. When the diode current has turned off, the drain voltage begins to oscillate because of the resonating network formed by the inductors ($L_p + L_{leak}$) and the lump capacitor. This voltage is reflected on the auxiliary winding wired in fly-back mode. Thus, by looking

at the auxiliary winding voltage, we can detect the end of the conduction time of secondary diode. The constant current control block picks up the leakage inductor current, the end of conduction of the output rectifier and controls the drain current to maintain the output current constant. We have:

$$I_{out} = \frac{V_{REF}}{2N_{sp} R_{sense}} \quad (eq. 1)$$

The output current value is set by choosing the sense resistor:

$$R_{sense} = \frac{V_{ref}}{2N_{sp} I_{out}} \quad (eq. 2)$$

From (eq. 1), the first key point is that the output current is independent of the inductor value. Moreover, the leakage inductance does not influence the output current value as the reset time is taken into account by the controller.

Figure 4. Flyback Currents and Auxiliary Winding Voltage in DCM

At this point the Excel® spreadsheet based design guide will help with many of the calculations.

A trim resistor allows for making fine adjustments to the current limit to set the output current precisely. The LFF

circuit will create some error on the Cs pin which is adjusted out by proper choice of R_{trim} . So we will choose $R_{sense} = 1.8 \Omega$ and use R_{trim} for the fine adjustments. After setting R_4 to $1.1 \text{ k}\Omega$, R_{trim} is 22Ω .

TEST PROCEDURE

Equipment Needed

- AC Source – 100 to 265 V ac 50/60 Hz Minimum 1 A ac capabilities
- AC Wattmeter – 30 W Minimum, True RMS Input Voltage and Current, Power Factor 0.2% accuracy or better
- DC Voltmeter – 100 V dc minimum 0.1% accuracy or better
- DC Ammeter – 1 A dc minimum 0.1% accuracy or better
- LED Load

- ♦ Flyback – 14–17 V dc – 5 LED Load @ 500 mA
- ♦ Buck Boost – 50–55 V dc – 15 LED Load @ 200 mA

Test Connections

1. Connect the Unit Under Test (UUT) per the test set up in Figure 17.
2. Set the AC source to 120 ±1 V ac RMS 60 Hz or 230 ±2 V ac RMS 50 Hz.

NOTE: Unless otherwise specified, all voltage measurements are taken at the terminals of the UUT.

$$\text{Efficiency} = ((V_{\text{OUT}} \times I_{\text{OUT}}) / P_{\text{in}}) \times 100\%$$

Step Dimming Test Procedure

NCL30083BB1GEVB/NCL30083FLYGEVB

1. Connect the UUT to the LED load.
2. Apply 120 V ac power.
3. Verify that the output current is within the regulation limits as specified in the functional test procedure.

4. Interrupting the AC input for 1–2 s will step the output current down.
5. There 6 discrete current levels. After the lowest level, the current will return to maximum output.
6. Cycle the input power 6 times validating that the current steps down at each cycle and returns to maximum.

APPENDIX

IEC61000–3–2 Class C Compliance

Compliance to IEC61000–3–2 Class C (under 25 W) is not possible with the valley fill front end architecture since input current does not comply with Class D requirements or the waveform definition requirements as stated in this excerpt.

Active Input Power ≤ 25 W:

Discharge lighting equipment having an active input power smaller than or equal to 25 W shall comply with one of the following two sets of requirements:

- The harmonic currents shall not exceed the power-related limits of Table 6, column 2, or:
- The third harmonic current, expressed as a percentage of the fundamental current, shall not exceed 86% and the fifth shall not exceed 61%; moreover, the waveform of the input current shall be such that it begins to flow before or at 60°, has its last peak (if there are several

peaks per half period) before or at 65° and does not stop flowing before 90°, where the zero crossing of the fundamental supply voltage is assumed to be at 0°.

If the discharge lighting equipment has a built-in dimming device, measurement is made only in the full load condition.

It is possible to comply with the special waveform and harmonic requirements of the third paragraph with a standard peak charge front end if the bulk capacitance is properly sized. The bulk capacitor must be in the range of 200–300 nF/W for a 230 V ac line for Europe. Japan has a similar requirement; however, the bulk capacitance must be 800–1,200 nF/W because the nominal main is 100 V ac rather than 230 V ac. The recommended capacitance values are line specific. So there is no universal mains solution with a peak charge front end. It is possible to convert the Evaluation Board from a valley fill to peak charge front end by deleting, changing, and shorting selected components.

NCL30083FLYGEVB, NCL30083BB1GEVB

Figure 31. Peak Charge Conversion for Evaluation Board

Table 6. BULK CAPACITOR SELECTION TABLE

Line	Minimum Capacitance	Maximum Capacitance	Voltage Rating
230 V ac 50 Hz	2.2 μ F	3.3 μ F	400 V dc
100 V ac 50/60 Hz	8.2 μ F	12 μ F	200 V dc

NOTE: Capacitance values based on 10 W output and selected to the nearest standard value.

To illustrate Class C performance, an NCL30083FLYGEVB was modified and the input valley fill configuration was modified and the input bulk capacitor was changed to 2.2 μ F, this is the typical performance data.

Typical harmonic content is illustrated in Figure 34. For applications with 4 LEDs or less, the input capacitor value should be reduced to meet Class C harmonic content requirements.

The evaluation board/kit (research and development board/kit) (hereinafter the "board") is not a finished product and is as such not available for sale to consumers. The board is only intended for research, development, demonstration and evaluation purposes and should as such only be used in laboratory/development areas by persons with an engineering/technical training and familiar with the risks associated with handling electrical/mechanical components, systems and subsystems. This person assumes full responsibility/liability for proper and safe handling. Any other use, resale or redistribution for any other purpose is strictly prohibited.

The board is delivered "AS IS" and without warranty of any kind including, but not limited to, that the board is production-worthy, that the functions contained in the board will meet your requirements, or that the operation of the board will be uninterrupted or error free. ON Semiconductor expressly disclaims all warranties, express, implied or otherwise, including without limitation, warranties of fitness for a particular purpose and non-infringement of intellectual property rights.

ON Semiconductor reserves the right to make changes without further notice to any board.

You are responsible for determining whether the board will be suitable for your intended use or application or will achieve your intended results. Prior to using or distributing any systems that have been evaluated, designed or tested using the board, you agree to test and validate your design to confirm the functionality for your application. Any technical, applications or design information or advice, quality characterization, reliability data or other services provided by ON Semiconductor shall not constitute any representation or warranty by ON Semiconductor, and no additional obligations or liabilities shall arise from ON Semiconductor having provided such information or services.

The boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. Should you purchase or use the board for any such unintended or unauthorized application, you shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by ON Semiconductor to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

ON Semiconductor does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: ON Semiconductor shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if ON Semiconductor is advised of the possibility of such damages. In no event shall ON Semiconductor's aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.
