

Software-Selectable Multiprotocol Transceiver

FEATURES

- **Software-Selectable Transceiver Supports:** RS232, RS449, EIA530, EIA530-A, V.35, V.36, X.21
- TUV/Detecon Inc. Certified NET1 and NET2 Compliant (Test Report No. NET2/102201/97)
- TBR2 Compliant (Test Report No. CTR2/022701/98)
- Software-Selectable Cable Termination Using the LTC1344A
- Complete DTE or DCE Port with LTC1544, LTC1344A
- Operates from Single 5V Supply

APPLICATIONS

- Data Networking
- CSU and DSU
- Data Routers

DESCRIPTION

The LTC[®]1543 is a 3-driver/3-receiver multiprotocol transceiver that operates from a single 5V supply. The LTC1543 and LTC1544 form the core of a complete software-selectable DTE or DCE interface port that supports the RS232, RS449, EIA530, EIA530-A, V.35, V.36 or X.21 protocols. Cable termination may be implemented using the LTC1344A software-selectable cable termination chip or by using existing discrete designs.

The LTC1543 runs from a single 5V supply using an internal charge pump that requires only five space-saving surface mounted capacitors. The part is available in a 28-lead SSOP surface mount package.

ABSOLUTE MAXIMUM RATINGS

(Note 1)

Supply Voltage	6.5V
Input Voltage	
Transmitters	$-0.3V$ to $(V_{CC} + 0.3V)$
Receivers	$-18V$ to $18V$
Logic Pins	$-0.3V$ to $(V_{CC} + 0.3V)$
Output Voltage	
Transmitters	$(V_{EE} - 0.3V)$ to $(V_{DD} + 0.3V)$
Receivers	$-0.3V$ to $(V_{CC} + 0.3V)$
Logic Pins	$-0.3V$ to $(V_{CC} + 0.3V)$
V_{EE}	$-10V$ to $0.3V$
V_{DD}	$-0.3V$ to $10V$
Short-Circuit Duration	
Transmitter Output	Indefinite
Receiver Output	Indefinite
V_{EE}	30 sec
Operating Temperature Range	
LTC1543C	$0^{\circ}C$ to $70^{\circ}C$
LTC1543I	$-40^{\circ}C$ to $85^{\circ}C$
Storage Temperature Range	$-65^{\circ}C$ to $150^{\circ}C$
Lead Temperature (Soldering, 10 sec)	$300^{\circ}C$

PIN FUNCTIONS

C1⁻ (Pin 1): Capacitor C1 Negative Terminal. Connect a 1 μ F capacitor between C1⁺ and C1⁻.

C1⁺ (Pin 2): Capacitor C1 Positive Terminal. Connect a 1 μ F capacitor between C1⁺ and C1⁻.

V_{DD} (Pin 3): Generated Positive Supply Voltage for V.28. Connect a 1 μ F capacitor to ground.

V_{CC} (Pin 4): Positive Supply Voltage Input. $4.75V \leq V_{CC} \leq 5.25V$. Bypass with a 1 μ F capacitor to ground.

D1 (Pin 5): TTL Level Driver 1 Input.

D2 (Pin 6): TTL Level Driver 2 Input.

D3 (Pin 7): TTL Level Driver 3 Input.

R1 (Pin 8): CMOS Level Receiver 1 Output.

R2 (Pin 9): CMOS Level Receiver 2 Output.

R3 (Pin 10): CMOS Level Receiver 3 Output.

M0 (Pin 11): TTL Level Mode Select Input 0 with Pull-Up to V_{CC}.

M1 (Pin 12): TTL Level Mode Select Input 1 with Pull-Up to V_{CC}.

M2 (Pin 13): TTL Level Mode Select Input 2 with Pull-Up to V_{CC}.

APPLICATIONS INFORMATION

Overview

The LTC1543/LTC1544 form the core of a complete software-selectable DTE or DCE interface port that supports the RS232, RS449, EIA530, EIA530-A, V.35, V.36 or X.21 protocols. Cable termination may be implemented using the LTC1344A software-selectable cable termination chip or by using existing discrete designs.

A complete DCE-to-DTE interface operating in EIA530 mode is shown in Figure 10. The LTC1543 of each port is used to generate the clock and data signals. The LTC1544 is used to generate the control signals along with LL (Local Loopback). The LTC1344A cable termination chip is used only for the clock and data signals because they must support V.35 cable termination. The control signals do not need any external resistors.

Mode Selection

The interface protocol is selected using the mode select pins M0, M1 and M2 (see the Mode Selection table).

For example, if the port is configured as a V.35 interface, the mode selection pins should be M2 = 1, M1 = 0, M0 = 0. For the control signals, the drivers and receivers will operate in V.28 (RS232) electrical mode. For the clock and data signals, the drivers and receivers will operate in V.35 electrical mode. The DCE/DTE pin will configure the port for DCE mode when high, and DTE when low.

The interface protocol may be selected simply by plugging the appropriate interface cable into the connector. The mode pins are routed to the connector and are left unconnected (1) or wired to ground (0) in the cable as shown in Figure 11.

The internal pull-up current sources will ensure a binary 1 when a pin is left unconnected and that the LTC1543/LTC1544 and the LTC1344A enter the no-cable mode when the cable is removed. In the no-cable mode the LTC1543/LTC1544 supply current drops to less than 200 μ A and all LTC1543/LTC1544 driver outputs and

LTC1344A resistive terminations are forced into a high impedance state.

APPLICATIONS INFORMATION

APPLICATIONS INFORMATION

Figure 13. V.10 Receiver Input Impedance

Figure 14. V.10 Receiver Configuration

V.11 (RS422) Interface

A typical V.11 balanced interface is shown in Figure 15. A V.11 differential generator with outputs A and B with ground C is connected to a differential receiver with ground C', inputs A' connected to A, B' connected to B. The V.11 interface has a differential termination at the receiver end that has a minimum value of 100Ω. The termination resistor is optional in the V.11 specification, but for the high speed clock and data lines, the termination is required to prevent reflections from corrupting the data. The receiver inputs must also be compliant with the impedance curve shown in Figure 13.

In V.11 mode, all switches are off except S1 inside the LTC1344A which connects a 103Ω differential termination impedance to the cable as shown in Figure 16.

APPLICATIONS INFORMATION

V.28 (RS232) Interface

A typical V.28 unbalanced interface is shown in Figure 17. A V.28 single-ended generator output A with ground C is connected to a single-ended receiver with input A' connected to A, ground C' connected via the signal return ground C.

In V.28 mode all switches are off except S3 inside the LTC1543/LTC1544 which connects a 6k (R8) impedance to ground in parallel with 20k (R5) plus 10k (R6) for a combined impedance of 5k as shown in Figure 18. The noninverting input is disconnected inside the LTC1543/LTC1544 receiver and connected to a TTL level reference voltage for a 1.4V receiver trip point.

Figure 17. Typical V.28 Interface

Figure 18. V.28 Receiver Configuration

V.35 Interface

APPLICATIONS INFORMATION

impedance of the receiver is placed in parallel with the T network termination, but does not affect the overall input impedance significantly.

The generator differential impedance must be 50Ω to 150Ω and the impedance between shorted terminals (A and B) and ground C must be $150\Omega \pm 15\Omega$. For the generator termination, switches S1 and S2 are both on and the top side of the center resistor is brought out to a pin so it can be bypassed with an external capacitor to reduce common mode noise as shown in Figure 21.

Any mismatch in the driver rise and fall times or skew in the driver propagation delays will force current through the center termination resistor to ground, causing a high frequency common mode spike on the A and B terminals. The common mode spike can cause EMI problems that are reduced by capacitor C1 which shunts much of the common mode energy to ground rather than down the cable.

Figure 21. V.35 Driver Using the LTC1344A

No-Cable Mode

The no-cable mode ($M0 = M1 = M2 = 1$) is intended for the case when the cable is disconnected from the connector. The charge pump, bias circuitry, drivers and receivers are turned off, the driver outputs are forced into a high impedance state, and the supply current drops to less than <

APPLICATIONS INFORMATION

DTE vs DCE Operation

The DCE/ $\overline{\text{DTE}}$ pin acts as an enable for Driver 3/Receiver 1 in the LTC1543, and Driver 3/Receiver 1 and Driver 4/Receiver 4 in the LTC1544. The INVERT pin in the LTC1544 allows the Driver 4/Receiver 4 enable to be high or low true polarity.

The LTC1543/LTC1544 can be configured for either DTE or DCE operation in one of two ways: a dedicated DTE or DCE port with a connector of appropriate gender or a port with one connector that can be configured for DTE or DCE operation by rerouting the signals to the LTC1543/LTC1544 using a dedicated DTE cable or dedicated DCE cable.

A dedicated DTE port using a DB-25 male connector is shown in Figure 23. The interface mode is selected by logic outputs from the controller or from jumpers to either V_{CC} or GND on the mode select pins. A dedicated DCE port using a DB-25 female connector is shown in Figure 24.

A port with one DB-25 connector, but can be configured for either DTE or DCE operation is shown in Figure 25. The configuration requires separate cables for proper signal routing in DTE or DCE operation. For example, in DTE mode, the TXD signal is routed to Pins 2 and 14 via Driver 1 in the LTC1543. In DCE mode, Driver 1 now routes the RXD signal to Pins 2 and 14.

Multiprotocol Interface with RL, LL, TM and a DB-25 Connector

If the RL, LL and TM signals are implemented, there are not enough drivers and receivers available in the LTC1543/LTC1544. In Figure 26, the required control signals are handled by the LTC1544 but the clock/data signals use the

LTC1343. The LTC1343 has an additional single-ended driver/receiver pair that can handle two more optional control signals such as TM and LL.

Cable-Selectable Multiprotocol Interface

A cable-selectable multiprotocol DTE/DCE interface is shown in Figure 27. The select lines M0, M1 and DCE/ $\overline{\text{DTE}}$
