AM571x (SR2.0, SR1.0)
AM570x (SR2.1, SR2.0)
Sitara™ Processors

Texas Instruments Sitara™ Families of Products

Technical Reference Manual

Literature Number: SPRUHZ7I
August 2015–Revised April 2019

Contents

Revision History **352**

Preface **353**

1 Introduction **360**

1.1 AM571x, AM570x Overview 361
1.2 AM571x, AM570x Environment 363
1.3 AM571x, AM570x Description 364
1.3.1 MPU Subsystem 365
1.3.2 DSP Subsystem 365
1.3.3 PRU-ICSS 365
1.3.4 IPU Subsystems 366
1.3.5 IVA-HD Subsystem 366
1.3.6 Display Subsystem 366
1.3.7 Video Processing Subsystem 367
1.3.8 Video Capture 367
1.3.9 3D GPU Subsystem 367
1.3.10 BB2D Subsystem 368
1.3.11 Camera Interface Subsystem 368
1.3.12 On-Chip Debug Support 369
1.3.13 Power, Reset, and Clock Management 369
1.3.14 On-Chip Memory 369
1.3.15 Memory Management 370
1.3.16 External Memory Interfaces 370
1.3.17 System and Connectivity Peripherals 370
1.3.17.1 System Peripherals 370
1.3.17.2 Media Connectivity Peripherals 371
1.3.17.3 Connectivity Peripherals 371
1.3.17.4 Audio Connectivity Peripherals 371
1.3.17.5 Serial Control Peripherals 372
1.4 AM571x, AM570x Family 373
1.5 AM571x, AM570x Device Identification 373
1.6 AM571x, AM570x Package Characteristics Overview 376

2 Memory Mapping **377**

2.1 Introduction 378
2.2 L3_MAIN Memory Map 380
2.2.1 L3_INSTR Memory Map 383
2.3 L4 Memory Map 384
2.3.1 L4_CFG Memory Map 384
2.3.2 L4_WKUP Memory Map 388
2.3.3 L4_PER Memory Map 390
2.3.3.1 L4_PER1 Memory Map 390
2.3.3.2 L4_PER2 Memory Map 392
2.3.3.3 L4_PER3 Memory Map 394
2.4 MPU Memory Map 396
2.5 IPU Memory Map 397
2.6 DSP Memory Map 399

2.7 PRU-ICSS Memory Map 400
2.8 TILER View Memory Map 401
3 Power, Reset, and Clock Management 402
3.1 Device Power Management Introduction 404
3.1.1 Device Power-Management Architecture Building Blocks 404
3.1.1.1 Clock Management 404
3.1.1.1.1 Module Interface and Functional Clocks 404
3.1.1.1.2 Module-Level Clock Management 405
3.1.1.1.3 Clock Domain 410
3.1.1.1.4 Clock Domain-Level Clock Management 411
3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences 413
3.1.1.1.6 Clock Domain Sleep/Wake-up 416
3.1.1.1.7 Clock Domain Dependency 416
3.1.1.2 Power Management 422
3.1.1.2.1 Power Domain 422
3.1.1.2.2 Module Logic and Memory Context 424
3.1.1.2.3 Power Domain Management 424
3.1.1.3 Voltage Management 426
3.1.1.3.1 Voltage Domain 426
3.1.1.3.2 Voltage Domain Management 427
3.1.1.3.3 AVS Overview 427
3.1.2 Power-Management Techniques 429
3.1.2.1 Standby Leakage Management 429
3.1.2.2 Dynamic Voltage and Frequency Scaling 430
3.1.2.3 Dynamic Power Switching 430
3.1.2.4 Adaptive Voltage Scaling 431
3.1.2.5 Adaptive Body Bias 431
3.1.2.6 SR3-APG (Automatic Power Gating) 432
3.1.2.7 Combining Power-Management Techniques 432
3.1.2.7.1 DPS Versus SLM 433
3.2 PRCM Subsystem Overview 434
3.2.1 Introduction 434
3.2.2 Power-Management Framework Features 435
3.3 PRCM Subsystem Environment 437
3.3.1 External Clock Signals 437
3.3.2 External Boot Signals 437
3.3.3 External Reset Signals 438
3.3.4 External Voltage Inputs 439
3.4 PRCM Subsystem Integration 441
3.4.1 Device Power-Management Layout 441
3.4.2 Power-Management Scheme, Reset, and Interrupt Requests 445
3.4.2.1 Power Domain 445
3.4.2.2 Resets 445
3.4.2.3 PRCM Interrupt Requests 446
3.5 Reset Management Functional Description 447
3.5.1 Overview 447
3.5.1.1 PRCM Reset Management Functional Description 447
3.5.1.1.1 Power-On Reset 447
3.5.1.1.2 Warm Reset 447
3.5.1.2 PRM Reset Management Functional Description 447
3.5.2 General Characteristics of Reset Signals 447
3.5.2.1 Scope 448
3.5.2.2 Occurrence 448

3.6 Clock Management Functional Description ... 483
3.6.1 Overview ... 483
3.6.2 External Clock Inputs ... 484
3.6.2.1 FUNC_32K_CLK Clock ... 484
3.6.2.2 High-Frequency System Clock Input ... 484
3.6.2.3 External Reference Clock Input ... 485
3.6.3 Internal Clock Sources and Generators ... 485
3.6.3.1 PRM Clock Source ... 485
3.6.3.2 CM Clock Source ... 487
3.6.3.2.1 CM_CORE_AON Clock Generator ... 487
3.6.3.2.2 CM_CORE_AON_CLKOUTMUX Overview ... 493
3.6.3.2.3 CM_CORE_AON_TIMER Overview ... 498
3.6.3.2.4 CM_CORE_AON_MCASP Overview ... 502
3.6.3.3 Generic DPLL Overview ... 504
3.6.3.3.1 Generic APLL Overview ... 505
3.6.3.3.2 DPLLs Output Clocks Parameters ... 506
3.6.3.3.3 Enable Control, Status, and Low-Power Operation Mode ... 508
3.6.3.3.4 DPLL Power Modes ... 508
3.6.3.3.5 DPLL Recalibration ... 510
3.6.3.3.6 DPLL Output Power Down ... 511
3.6.3.4 DPLL_PER Description ... 511
3.6.3.4.1 DPLL_PER Overview ... 511
3.6.3.4.2 DPLL_PER Synthesized Clock Parameters ... 511
3.6.3.4.3 DPLL_PER Power Modes ... 512
3.6.3.4.4 DPLL_PER Recalibration ... 512
3.6.3.5 DPLL_CORE Description ... 513
3.6.3.5.1 DPLL_CORE Overview ... 513
3.6.3.5.2 DPLL_CORE Synthesized Clock Parameters ... 513
3.6.3.5.3 DPLL_CORE Power Modes ... 514
3.6.3.5.4 DPLL_CORE Recalibration ... 515
3.6.3.6 DPLL_ABE Description ... 515
3.6.3.6.1 DPLL_ABE Overview ... 515
3.6.3.6.2 DPLL_ABE Synthesized Clock Parameters ... 515

3.6.3.6.3 DPLL_ABE Power Modes 516
3.6.3.6.4 DPLL_ABE Recalibration 516
3.6.3.7 DPLL_MPU Description 517
3.6.3.7.1 DPLL_MPU Overview 517
3.6.3.7.2 DPLL_MPU Tactical Clocking Adjustment 517
3.6.3.7.3 DPLL_MPU Synthesized Clock Parameters 517
3.6.3.7.4 DPLL_MPU Power Modes 517
3.6.3.7.5 DPLL_MPU Recalibration 518
3.6.3.8 DPLL_IVA Description 518
3.6.3.8.1 DPLL_IVA Overview 518
3.6.3.8.2 DPLL_IVA Synthesized Clock Parameters 519
3.6.3.8.3 DPLL_IVA Power Modes 519
3.6.3.8.4 DPLL_IVA Recalibration 520
3.6.3.9 DPLL_USB Description 520
3.6.3.9.1 DPLL_USB Overview 520
3.6.3.9.2 DPLL_USB Synthesized Clock Parameters 520
3.6.3.9.3 DPLL_USB Power Modes 521
3.6.3.9.4 DPLL_USB Recalibration 521
3.6.3.10 DPLL_DSP Description 521
3.6.3.10.1 DPLL_DSP Overview 521
3.6.3.10.2 DPLL_DSP Synthesized Clock Parameters 522
3.6.3.10.3 DPLL_DSP Power Modes 522
3.6.3.10.4 DPLL_DSP Recalibration 522
3.6.3.11 DPLL_GMAC Description 523
3.6.3.11.1 DPLL_GMAC Overview 523
3.6.3.11.2 DPLL_GMAC Synthesized Clock Parameters 523
3.6.3.11.3 DPLL_GMAC Power Modes 524
3.6.3.11.4 DPLL_GMAC Recalibration 524
3.6.3.12 DPLL_GPU Description 525
3.6.3.12.1 DPLL_GPU Overview 525
3.6.3.12.2 DPLL_GPU Synthesized Clock Parameters 525
3.6.3.12.3 DPLL_GPU Power Modes 525
3.6.3.12.4 DPLL_GPU Recalibration 526
3.6.3.13 DPLL_DDR Description 526
3.6.3.13.1 DPLL_DDR Overview 526
3.6.3.13.2 DPLL_DDR Synthesized Clock Parameters 526
3.6.3.13.3 DPLL_DDR Power Modes 527
3.6.3.13.4 DPLL_DDR Recalibration 527
3.6.3.14 DPLL_PCIE_REF Description 528
3.6.3.14.1 DPLL_PCIE_REF Overview 528
3.6.3.14.2 DPLL_PCIE_REF Synthesized Clock Parameters 528
3.6.3.14.3 DPLL_PCIE_REF Power Modes 528
3.6.3.15 APLL_PCIE Description 529
3.6.3.15.1 APLL_PCIE Overview 529
3.6.3.15.2 APLL_PCIE Synthesized Clock Parameters 529
3.6.3.15.3 APLL_PCIE Power Modes 529
3.6.4 Clock Domains 530
3.6.4.1 CD_WKUPAON Clock Domain 530
3.6.4.1.1 CD_WKUPAON Overview 530
3.6.4.1.2 CD_WKUPAON Clock Domain Modes 530
3.6.4.1.3 CD_WKUPAON Clock Domain Dependency 531
3.6.4.1.4 CD_WKUPAON Clock Domain Module Attributes 533
3.6.4.2 CD_DSP1 Clock Domain 535

3.6.4.2.1 CD_DSP1 Overview 535
3.6.4.2.2 CD_DSP1 Clock Domain Modes 535
3.6.4.2.3 CD_DSP1 Clock Domain Dependency 536
3.6.4.2.4 CD_DSP1 Clock Domain Module Attributes 537
3.6.4.3 CD_CUSTEFUSE Clock Domain 538
3.6.4.3.1 CD_CUSTEFUSE Overview 538
3.6.4.3.2 CD_CUSTEFUSE Clock Domain Modes 538
3.6.4.3.3 CD_CUSTEFUSE Clock Domain Dependency 539
3.6.4.3.4 CD_CUSTEFUSE Clock Domain Module Attributes 539
3.6.4.4 CD_MPU Clock Domain 539
3.6.4.4.1 CD_MPU Overview 539
3.6.4.4.2 CD_MPU Clock Domain Modes 540
3.6.4.4.3 CD_MPU Clock Domain Dependency 540
3.6.4.4.4 CD_MPU Clock Domain Module Attributes 541
3.6.4.5 CD_L4PER1 Clock Domain 542
3.6.4.5.1 CD_L4PER1 Overview 542
3.6.4.5.2 CD_L4PER1 Clock Domain Modes 543
3.6.4.5.3 CD_L4PER1 Clock Domain Dependency 544
3.6.4.5.4 CD_L4PER1 Clock Domain Module Attributes 557
3.6.4.6 CD_L4PER2 Clock Domain 563
3.6.4.6.1 CD_L4PER2 Overview 563
3.6.4.6.2 CD_L4PER2 Clock Domain Modes 564
3.6.4.6.3 CD_L4PER2 Clock Domain Dependency 565
3.6.4.6.4 CD_L4PER2 Clock Domain Module Attributes 570
3.6.4.7 CD_L4PER3 Clock Domain 574
3.6.4.7.1 CD_L4PER3 Overview 574
3.6.4.7.2 CD_L4PER3 Clock Domain Modes 574
3.6.4.7.3 CD_L4PER3 Clock Domain Dependency 575
3.6.4.7.4 CD_L4PER3 Clock Domain Module Attributes 575
3.6.4.8 CD_L4SEC Clock Domain 576
3.6.4.8.1 CD_L4SEC Overview 576
3.6.4.8.2 CD_L4SEC Clock Domain Modes 577
3.6.4.8.3 CD_L4SEC Clock Domain Dependency 577
3.6.4.8.4 CD_L4SEC Clock Domain Module Attributes 578
3.6.4.9 CD_L3INIT Clock Domain 579
3.6.4.9.1 CD_L3INIT Overview 579
3.6.4.9.2 CD_L3INIT Clock Domain Modes 580
3.6.4.9.3 CD_L3INIT Clock Domain Dependency 581
3.6.4.9.4 CD_L3INIT Clock Domain Module Attributes 584
3.6.4.10 CD_IVA Clock Domain 587
3.6.4.10.1 CD_IVA Overview 587
3.6.4.10.2 CD_IVA Clock Domain Modes 587
3.6.4.10.3 CD_IVA Clock Domain Dependency 588
3.6.4.10.4 CD_IVA Clock Domain Module Attributes 588
3.6.4.11 CD_GPU Description 589
3.6.4.11.1 CD_GPU Overview 589
3.6.4.11.2 CD_GPU Clock Domain Modes 589
3.6.4.11.3 CD_GPU Clock Domain Dependency 590
3.6.4.11.4 CD_GPU Clock Domain Module Attributes 590
3.6.4.12 CD_EMU Clock Domain 591
3.6.4.12.1 CD_EMU Overview 591
3.6.4.12.2 CD_EMU Clock Domain Modes 592
3.6.4.12.3 CD_EMU Clock Domain Dependency 592

3.6.4.13 CD_DSS Clock Domain 593
3.6.4.13.1 CD_DSS Overview 593
3.6.4.13.2 CD_DSS Clock Domain Modes 593
3.6.4.13.3 CD_DSS Clock Domain Dependency 594
3.6.4.13.4 CD_DSS Clock Domain Module Attributes 597
3.6.4.14 CD_L4_CFG Clock Domain 598
3.6.4.14.1 CD_L4_CFG Overview 598
3.6.4.14.2 CD_L4_CFG Clock Domain Modes 598
3.6.4.14.3 CD_L4_CFG Clock Domain Dependency 599
3.6.4.14.4 CD_L4_CFG Clock Domain Module Attributes 599
3.6.4.15 CD_L3_INSTR Clock Domain 602
3.6.4.15.1 CD_L3_INSTR Overview 602
3.6.4.15.2 CD_L3_INSTR Clock Domain Modes 602
3.6.4.15.3 CD_L3_INSTR Clock Domain Dependency 602
3.6.4.15.4 CD_L3_INSTR Clock Domain Module Attributes 603
3.6.4.16 CD_L3_MAIN1 Clock Domain 604
3.6.4.16.1 CD_L3_MAIN1 Overview 604
3.6.4.16.2 CD_L3_MAIN1 Clock Domain Modes 605
3.6.4.16.3 CD_L3_MAIN1 Clock Domain Dependency 605
3.6.4.16.4 CD_L3_MAIN1 Clock Domain Module Attributes 606
3.6.4.17 CD_EMIF Clock Domain 608
3.6.4.17.1 CD_EMIF Overview 608
3.6.4.17.2 CD_EMIF Clock Domain Modes 608
3.6.4.17.3 CD_EMIF Clock Domain Dependency 609
3.6.4.17.4 CD_EMIF Clock Domain Module Attributes 609
3.6.4.18 CD_IPU Clock Domain 610
3.6.4.18.1 CD_IPU Overview 610
3.6.4.18.2 CD_IPU Clock Domain Modes 610
3.6.4.18.3 CD_IPU Clock Domain Dependency 611
3.6.4.18.4 CD_IPU Clock Domain Module Attributes 612
3.6.4.19 CD_IPU1 Clock Domain 614
3.6.4.19.1 CD_IPU1 Overview 614
3.6.4.19.2 CD_IPU1 Clock Domain Modes 614
3.6.4.19.3 CD_IPU1 Clock Domain Dependency 615
3.6.4.19.4 CD_IPU1 Clock Domain Module Attributes 616
3.6.4.20 CD_IPU2 Clock Domain 617
3.6.4.20.1 CD_IPU2 Overview 617
3.6.4.20.2 CD_IPU2 Clock Domain Modes 617
3.6.4.20.3 CD_IPU2 Clock Domain Dependency 617
3.6.4.20.4 CD_IPU2 Clock Domain Module Attributes 619
3.6.4.21 CD_DMA Clock Domain 619
3.6.4.21.1 CD_DMA Overview 619
3.6.4.21.2 CD_DMA Clock Domain Modes 620
3.6.4.21.3 CD_DMA Clock Domain Dependency 620
3.6.4.21.4 CD_DMA Clock Domain Module Attributes 621
3.6.4.22 CD_ATL Clock Domain 622
3.6.4.22.1 CD_ATL Overview 622
3.6.4.22.2 CD_ATL Clock Domain Modes 622
3.6.4.22.3 CD_ATL Clock Domain Module Attributes 623
3.6.4.23 CD_CAM Clock Domain 624
3.6.4.23.1 CD_CAM Overview 624
3.6.4.23.2 CD_CAM Clock Domain Modes 624

3.6.4.23.3 CD_CAM Clock Domain Dependency 625
3.6.4.23.4 CD_CAM Clock Domain Module Attributes 625
3.6.4.24 CD_GMAC Clock Domain 627
3.6.4.24.1 CD_GMAC Overview 627
3.6.4.24.2 CD_GMAC Clock Domain Modes 627
3.6.4.24.3 CD_GMAC Clock Domain Dependency 628
3.6.4.24.4 CD_GMAC Clock Domain Module Attributes 628
3.6.4.25 CD_VPE Clock Domain 629
3.6.4.25.1 CD_VPE Overview 629
3.6.4.25.2 CD_VPE Clock Domain Modes 629
3.6.4.25.3 CD_VPE Clock Domain Dependency 630
3.6.4.25.4 CD_VPE Clock Domain Module Attributes 630
3.6.4.26 CD_RTC Clock Domain 631
3.6.4.26.1 CD_RTC Overview 631
3.6.4.26.2 CD_RTC Clock Domain Modes 632
3.6.4.26.3 CD_RTC Clock Domain Dependency 632
3.6.4.26.4 CD_RTC Clock Domain Module Attributes 633
3.6.4.27 CD_PCIE Clock Domain 634
3.6.4.27.1 CD_PCIE Overview 634
3.6.4.27.2 CD_PCIE Clock Domain Modes 634
3.6.4.27.3 CD_PCIE Clock Domain Dependency 635
3.6.4.27.4 CD_PCIE Clock Domain Module Attributes 636
3.7 Power Management Functional Description 638
3.7.1 PD_WKUPAON Description 638
3.7.1.1 PD_WKUPAON Power Domain Modes 639
3.7.1.1.1 PD_WKUPAON Logic and Memory Area Power Modes 639
3.7.2 PD_DSP1 Description 639
3.7.2.1 PD_DSP1 Power Domain Modes 640
3.7.2.1.1 PD_DSP1 Logic and Memory Area Power Modes 640
3.7.2.1.2 PD_DSP1 Logic and Memory Area Power Modes Control and Status 640
3.7.3 PD_CUSTEFUSE Description 641
3.7.3.1 PD_CUSTEFUSE Power Domain Modes 641
3.7.3.1.1 PD_CUSTEFUSE Logic and Memory Area Power Modes 641
3.7.3.1.2 PD_CUSTEFUSE Logic and Memory Area Power Modes Control and Status 641
3.7.4 PD_MPU Description 642
3.7.4.1 PD_MPU Power Domain Modes 642
3.7.4.1.1 PD_MPU Logic and Memory Area Power Modes 642
3.7.4.1.2 PD_MPU Logic and Memory Area Power Modes Control and Status 643
3.7.4.1.3 PD_MPU Power State Override 643
3.7.5 PD_IPU Description 644
3.7.5.1 PD_IPU Power Domain Modes 644
3.7.5.1.1 PD_IPU Logic and Memory Area Power Modes 644
3.7.5.1.2 PD_IPU Logic and Memory Area Power Modes Control and Status 645
3.7.6 PD_L3INIT Description 645
3.7.6.1 PD_L3INIT Power Domain Modes 646
3.7.6.1.1 PD_L3INIT Logic and Memory Area Power Modes 646
3.7.6.1.2 PD_L3INIT Logic and Memory Area Power Modes Control and Status 646
3.7.7 PD_L4PER Description 647
3.7.8 PD_IVA Description 647
3.7.8.1 PD_IVA Power Domain Modes 648
3.7.8.1.1 PD_IVA Logic and Memory Area Power Modes 648
3.7.8.1.2 PD_IVA Logic and Memory Area Power Modes Control and Status 648
3.7.9 PD_GPU Description 649

Copyright © 2015–2019, Texas Instruments Incorporated

3.7.9.1 PD_GPU Power Domain Modes 649
3.7.9.1.1 PD_GPU Logic and Memory Area Power Modes 650
3.7.9.1.2 PD_GPU Logic and Memory Area Power Modes Control and Status 650
3.7.10 PD_EMU Description 650
3.7.11 PD_DSS Description 651
3.7.11.1 PD_DSS Power Domain Modes 651
3.7.11.1.1 PD_DSS Logic and Memory Area Power Modes 651
3.7.11.1.2 PD_DSS Logic and Memory Area Power Mode Control and Status 651
3.7.12 PD_CORE Description 652
3.7.12.1 PD_CORE Power Domain Modes 653
3.7.12.1.1 PD_CORE Logic and Memory Area Power Modes 653

5.4.3.2 DSP_SYSTEM Register Description 1687
5.4.4 DSP_FW_L2_NOC_CFG Registers 1703
5.4.4.1 DSP_FW_L2_NOC_CFG Register Summary 1703

Copyright © 2015–2019, Texas Instruments Incorporated

5.4.4.2 DSP_FW_L2_NOC_CFG Register Description 1706
6 IVA Subsystem 1723
7 Dual Cortex-M4 IPU Subsystem 1724
7.1 Dual Cortex-M4 IPU Subsystem Overview 1725
7.1.1 Introduction 1725
7.1.2 Features 1727
7.2 Dual Cortex-M4 IPU Subsystem Integration 1728
7.2.1 Dual Cortex-M4 IPU Subsystem Clock and Reset Distribution 1730
7.2.1.1 Clock Distribution 1730
7.2.1.2 Reset Distribution 1731
7.3 Dual Cortex-M4 IPU Subsystem Functional Description 1733
7.3.1 IPUx Subsystem Block Diagram 1733
7.3.2 Power Management 1734
7.3.2.1 Local Power Management 1734
7.3.2.2 Power Domains 1735
7.3.2.3 Voltage Domain 1735
7.3.2.4 Power States and Modes 1735
7.3.2.5 Wake-Up Generator (IPUx_WUGEN) 1737
7.3.2.5.1 IPUx_WUGEN Main Features 1737
7.3.3 IPUx_UNICACHE 1738
7.3.4 IPUx_UNICACHE_MMU 1739
7.3.5 IPUx_UNICACHE_SCTM 1740
7.3.5.1 Counter Functions 1740
7.3.5.1.1 Input Events 1740
7.3.5.1.2 Counters 1741
7.3.5.2 Timer Functions 1742
7.3.5.2.1 Periodic Intervals 1742
7.3.5.2.2 Event Generation 1742
7.3.6 IPUx_MMU 1743
7.3.6.1 IPUx_MMU Behavior on Page-Fault in IPUx Subsystem 1743
7.3.7 Interprocessor Communication (IPC) 1743
7.3.7.1 Use of WFE and SEV 1743
7.3.7.2 Use of Interrupt for IPC 1744
7.3.7.3 Use of the Bit-Band Feature for Semaphore Operations 1744
7.3.7.4 Private Memory Space 1745
7.3.8 IPU Boot Options 1745
7.4 Dual Cortex-M4 IPU Subsystem Register Manual 1746
7.4.1 IPUx Subsystem Instance Summary 1746
7.4.2 IPUx_UNICACHE_CFG Registers 1746
7.4.2.1 IPUx_UNICACHE_CFG Register Summary 1746
7.4.2.2 IPUx_UNICACHE_CFG Register Description 1747
7.4.3 IPUx_UNICACHE_SCTM Registers 1753
7.4.3.1 IPUx_UNICACHE_SCTM Register Summary 1753
7.4.3.2 IPUx_UNICACHE_SCTM Register Description 1754
7.4.4 IPUx_UNICACHE_MMU (AMMU) Registers 1760
7.4.4.1 IPUx_UNICACHE_MMU (AMMU) Register Summary 1760
7.4.4.2 IPUx_UNICACHE_MMU (AMMU) Register Description 1762
7.4.5 IPUx_MMU Registers 1769
7.4.6 IPUx_Cx_INTC Registers 1769
7.4.7 IPUx_WUGEN Registers 1769
7.4.7.1 IPUx_WUGEN Register Summary 1769
7.4.7.2 IPUx_WUGEN Register Description 1770
7.4.8 IPUx_Cx_RW_TABLE Registers 1774

8.5.3.2 CSI2 PHY Register Description 1888
9 Video Input Port 1892
9.1 VIP Overview 1893
9.2 VIP Environment 1895
9.3 VIP Integration 1898
9.4 VIP Functional Description 1899
9.4.1 VIP Block Diagram 1899
9.4.2 VIP Software Reset 1900
9.4.3 VIP Power and Clocks Management 1900
9.4.3.1 VIP Clocks 1901
9.4.3.2 VIP Idle Mode 1901
9.4.3.3 VIP StandBy Mode 1901
9.4.4 VIP Slice 1901
9.4.4.1 VIP Slice Processing Path Overview 1901
9.4.4.2 VIP Slice Processing Path Multiplexers 1903
9.4.4.2.1 VIP_CSC Multiplexers 1903
9.4.4.2.2 VIP_SC Multiplexer 1903
9.4.4.2.3 Output to VPDMA Multiplexers 1903
9.4.4.3 VIP Slice Processing Path Examples 1903
9.4.4.3.1 Input: A=RGB, B=YUV422; Output: A=RGB, B=RGB 1904
9.4.4.3.2 Input: A=YUV422 8/16, B=YUV422; Output: A=Scaled YUV420, B=RGB 1905
9.4.4.3.3 Input: A=RGB, B=YUV422; Output: A=RGB, B=Scaled YUV420 1906
9.4.4.3.4 Input: A=YUV444, B=YUV422; Output: A=YUV422, A=Scaled YUV422, B=YUV422 1907
9.4.4.3.5 Input: A=YUV444; Output: A=Scaled YUV420, A=YUV420 1908
9.4.4.3.6 Input: A=YUV444; Output: A=Scaled YUV420, A=YUV444 1909
9.4.4.3.7 Input: A=YUV422 8/16; Output: A=Scaled YUV420, A=YUV444 1910
9.4.4.3.8 Input: A=YUV422 8/16, B=YUV422; Output: A=Scaled YUV420, B=YUV420 1911
9.4.4.3.9 Input: A=YUV422 8/16, B=YUV422; Output: A=YUV420, B=YUV420 1912
9.4.5 VIP Parser 1912
9.4.5.1 Features 1913
9.4.5.2 Repacker 1913
9.4.5.3 Analog Video 1915

Revision History

Additional details regarding key changes can be found in the Extended Revision History located in Appendix B.

Changes from May 29, 2018 to April 8, 2019 (from H Revision (May 2018) to I Revision) **Page**

- Removed References to OpenGL from Chapter Introduction. See Appendix B for more details 367
- Updated Speed Grade in Table AM571x, AM570x Part Number Identifier. See Appendix B for more details 373
- Added Clarification about IPU Access to System Resources. See Appendix B for more details..... 397
- Updated Figure CM_CORE_AON Overview (a). See Appendix B for more details..... 489
- Added Section PRCM Software Configuration for OPP_PLUS. See Appendix B for more details..... 678
- Added an Additional Operating Performance Point (OPP_PLUS). See Appendix B for more details..... 1571
- Added an OPP_LOW for MPU Domain. See Appendix B for more details 1571
- Removed Registers CACHE_MMU_MAINT, CACHE_MMU_MTSTART, CACHE_MMU_MTEND and CACHE_MMU_MAINTST. Updated Description of CACHE_MAINT Register. See Appendix B for more details..... 1750
- Added CAL LINE_NUMBER_IRQ Register Bit. See Appendix B for more details..... 1787
- Updated Figure DISPC RGB to YUV Registers (FullRange=1). See Appendix B for more details..... 2735
- Removed References to OpenGL from Chapter 3D Graphic Accelerator. See Appendix B for more details 2952
- Updated EffectiveResolution Parameter Value. See Appendix B for more details..... 3040
- Updated Table EMIF Configuration Sequence. See Appendix B for more details 3416
- Updated GPMC XIP Timing Parameters. See Appendix B for more details..... 3543
- Added an Additional Operating Performance Point (OPP_PLUS). See Appendix B for more details..... 4168
- Added an OPP_LOW for MPU Domain. See Appendix B for more details 4168
- Added TSHUT Software Override Bits. See Appendix B for more details 4228
- Updated Description of the CTRL_CORE_BOOTSTRAP[15] DSP_CLOCK_DIVIDER Bit. See Appendix B for more details 4300
- Updated Bit-Field Names of CTRL_CORE_SMA_SW_7 Register. See Appendix B for more details 4838
- Updated Fast Mode Column Settings for SCLL and SCLH. See Appendix B for more details 5587
- Updated Figure in Multimaster High-Speed I2C Controller. See Appendix B for more details..... 5606
- Removed Caution from HS I2C Registers. See Appendix B for more details 5613
- Updated Entire Subsection McSPI Programming Guide. See Appendix B for more details..... 5822
- Updated PCIe MSI Interrupt Service Routine. See Appendix B for more details 6155
- Updated UNDERSIZE_RX_FRAMES Register Description. See Appendix B for more details..... 6602
- Updated Note for MMCHS_HCTL[2] HSPE Bit and Added Note for MMCHS_CAPA[21] HSS Bit. See Appendix B for more details 6800
- Added Footnote for Genx and Genm. See Appendix B for more details..... 6857
- Added MEM_DLL_PHINT_RATE to Low-Level Programming Sequence. See Appendix B for more details 6857
- Updated Note in Section PRU-ICSS MII RT Module and Description of PRUSS_MII_RT_TXCFG0/1[30:28] TX_CLK_DELAY Bitfield. See Appendix B for more details 7402

About This Manual

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Copyright © 2015–2019, Texas Instruments Incorporated

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: <*Module name*>.<*Register name*>; for example: UART.UASR
- For a bit field call:
  - <*Module name*>.<*Register name*>*[End:Start]* <*Field name*> *field*; for example, UART.UASR[4:0] SPEED bit field
  - <*Field name*> *field* <*Module name*>.<*Register name*>*[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - <*Module name*>.<*Register name*>*[pos]* <*Bit name*> *bit*; for example, UART.UASR[5] BIT_BY_CHAR bit
  - <*Bit name*> *bit* <*Module name*>.<*Register name*>*[pos]*; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatileUint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Copyright © 2015–2019, Texas Instruments Incorporated

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

Introduction

This chapter introduces the features, subsystems, and architecture of the AM571x and AM570x families of high-performance processors.

Topic **Page**

1.1 AM571x, AM570x Overview 361
1.2 AM571x, AM570x Environment 363
1.3 AM571x, AM570x Description 364
1.4 AM571x, AM570x Family 373
1.5 AM571x, AM570x Device Identification 373
1.6 AM571x, AM570x Package Characteristics Overview 376

Copyright © 2015–2019, Texas Instruments Incorporated

1.1 AM571x, AM570x Overview

The AM571x, AM570x is a high-performance, Sitara™ device, integrated on a 28-nm technology.

- The architecture is designed for industrial automation applications including advanced Human Machine Interface (HMI), industrial communication, automation and control, and other high performance and general use applications, and best-in-class CPU performance, video, image, and graphics processing sufficient to support:
  - Streaming video up to full high definition (Full-HD) (1920 × 1080p, 60 fps)
  - 2-dimensional (2D) and 3-dimensional (3D) graphics and composition

NOTE: This TRM describes all subsystems and modules which are available on the superset device. The supported set of features and peripherals is device part number dependent. Refer to the device Data Manual, for more information.

- The device is composed of the following subsystems:
  - Arm® Cortex®-A15 microprocessor unit (MPU) subsystem, including one Arm Cortex-A15 core
  - One digital signal processor (DSP) C66x subsystem
  - Image and video accelerator high-definition (IVA-HD) subsystem
    - 4K @ 15fps encode and decode support for H.264 CODEC
    - Other CODECs up to 1080p60
  - Two Arm® Cortex®-M4 image processing unit (IPU) subsystems, each including two Arm Cortex-M4 microprocessors available for general purpose usage
  - Display subsystem (DSS)
  - Video processing engine (VPE) subsystem
  - Video input port (VIP) capture
  - 3D-graphics processing unit (GPU) subsystem, including one POWERVR® SGX544 core
  - BB2D subsystem, including Vivante™ GC320 core
  - Camera Adaptation Layer, providing support for up to two MIPI® CSI-2 interfaces
  - Three pulse-width modulation (PWM) subsystems
  - Real-time clock (RTC) subsystem
    Note: RTC is only available on the AM571x family of devices
  - Two dual-core Programmable Real-time Unit and Industrial Communication Subsystems (PRU-ICSS).
  - Debug subsystem
- The device provides a rich set of connectivity peripherals, including among others:
  - One USB3.0 subsystem and one USB2.0 subsystem
  - SATA 2 subsystem
    Note: SATA is only available on the AM571x family of devices
  - Two PCI Express Gen2 subsystems
  - 3-port Gigabit Ethernet Switch subsystem
- The device includes support for:
  - Error detection and correction:
    - Parity bit per byte on C66x DSP L1 program cache and single-error correction dual-error detection (SECDED) on L2 memories on the DSP
    - SECDED on large L3 memory
  - MMU/MPU
    - MMU used for key masters (Cortex-A15 MPU, Cortex-M4 IPU, C66x DSP, EDMA)
    - Memory protection of C66x core
    - MMU inside the Dynamic Memory Manager

Copyright © 2015–2019, Texas Instruments Incorporated

- The device includes state-of-the-art integrated power-management techniques required for high-performance products.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System peripherals
  - Audio, media and connectivity peripherals

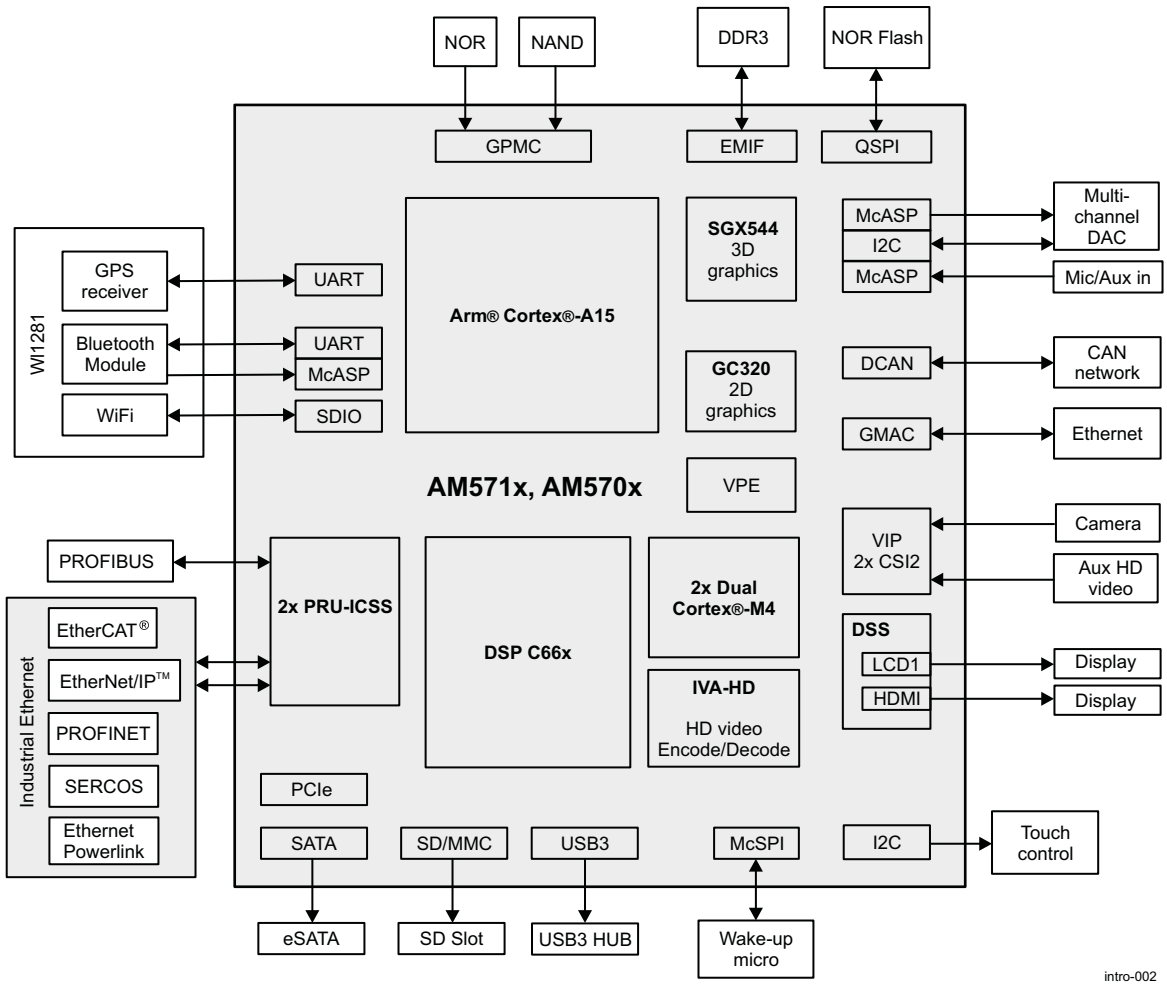
1.2 AM571x, AM570x Environment

This section provides an overview of the AM571x, AM570x environment.

Figure 1-1 is an example for a non-exhaustive environment for the AM571x, AM570x device.

Figure 1-1. AM571x, AM570x Sample Environment Diagram



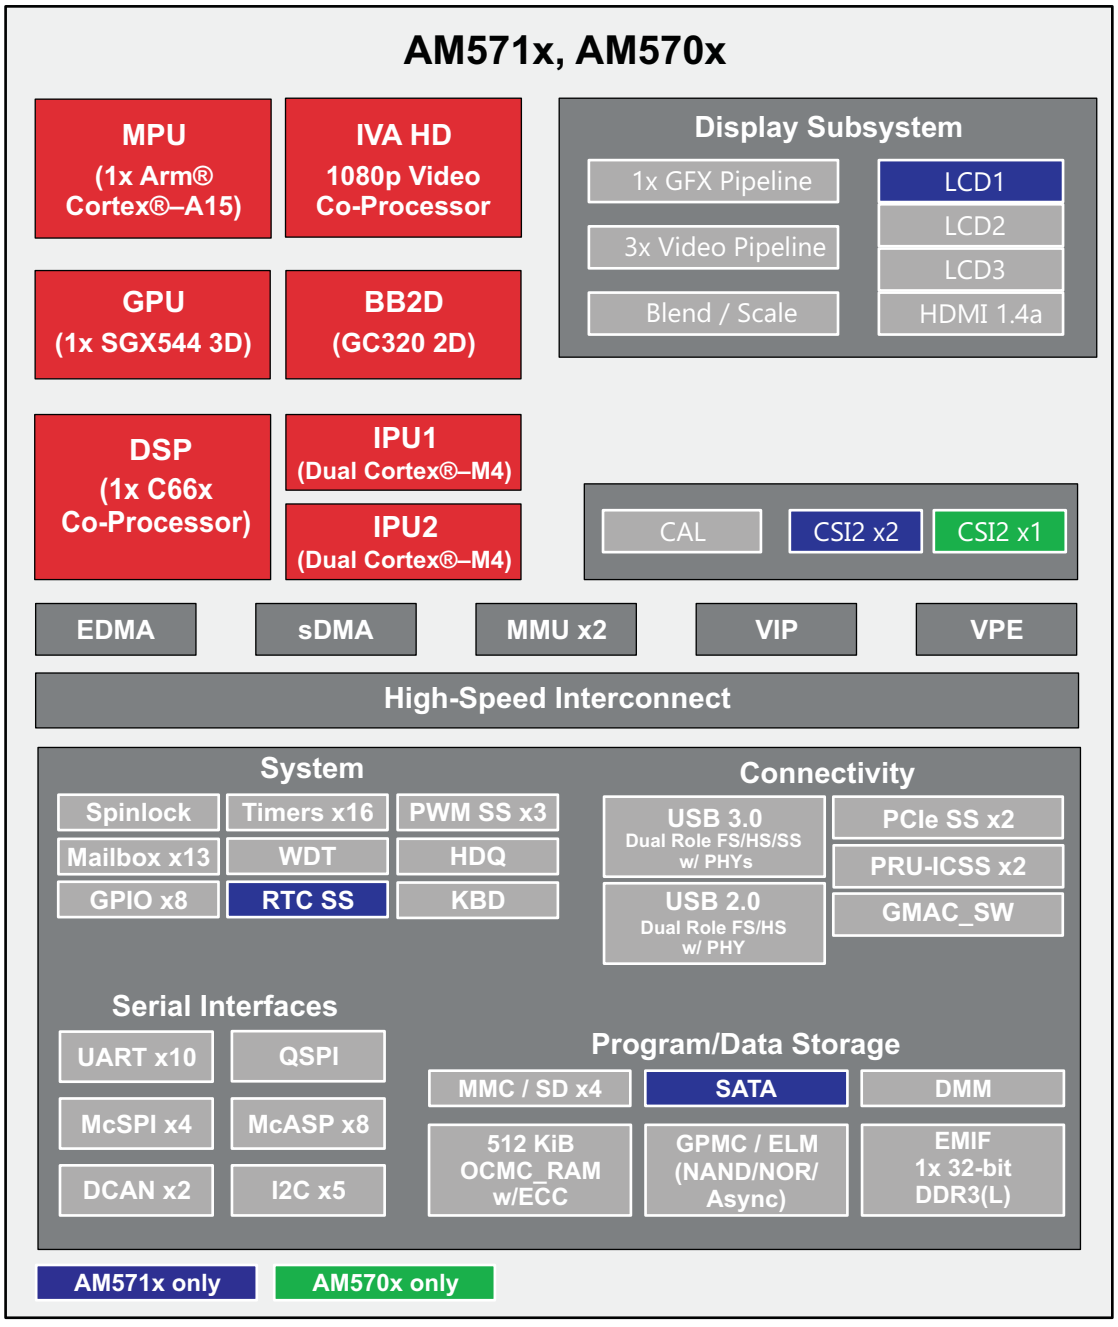
NOTE: SATA and second CSI2 instance (CSI2_PHY2) are not supported on the AM570x family of devices.

Copyright © 2015–2019, Texas Instruments Incorporated

1.3 AM571x, AM570x Description

Figure 1-2 is the block diagram of AM571x, AM570x device.

Figure 1-2. AM571x, AM570x Block Diagram



intro-001

NOTE: The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

1.3.1 MPU Subsystem

The Cortex-A15 MPU subsystem integrates the following submodules:

- Arm Cortex-A15 MPCore
  - One central processing unit (CPU)
  - Arm Version 7 ISA: Standard Arm instruction set plus Arm® Thumb®-2, Arm® Jazelle® RCT Java™ accelerator, hardware virtualization support, and large physical address extensions (LPAE)
  - Arm® Neon™ SIMD coprocessor and VFPv4 per CPU
  - Interrupt controller with up to 160 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KiB instruction and 32-KiB data level 1 (L1) cache per CPU
- Shared 1-MiB level 2 (L2) cache with ECC
- 48-KiB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 DSP Subsystem

There is one DSP subsystem in the device containing the following submodules:

- TMS320C66x™ VLIW DSP core for audio processing, and general-purpose imaging and video processing. It extends the performance of existing C64x+™ and C647x™ DSPs through enhancements and new features.
  - 32-KiB L1D and 32-KiB L1P cache or addressable SRAM
  - 288-KiB L2 cache
    - 256-KiB configurable as cache or SRAM
    - 32-KiB SRAM
- Enhanced direct memory access (EDMA) engine for video and audio data transfer
- Memory management units (MMU) for address management.
- Interrupt controller (INTC)
- Emulation capabilities

1.3.3 PRU-ICSS

There are two Programmable Real-time Unit and Industrial Communication Subsystems (PRU-ICSS) in the device. Each PRU-ICSS consists of dual 32-bit RISC cores (Programmable Real-Time Units, or PRUs), shared data and instruction memories, internal peripheral modules, and an interrupt controller (INTC).

Among the interfaces supported by the PRU-ICSS are real-time industrial protocols used in master and slave mode, such as:

- EtherCAT®
- PROFINET
- EtherNet/IP™
- PROFIBUS
- Ethernet Powerlink
- SERCOS

Other features include:

- 2x Channel EnDAT 2.2/SCU
- 18x Channel Sigma-Delta/SCU

Copyright © 2015–2019, Texas Instruments Incorporated

- CRC 16/32

1.3.4 IPU Subsystems

There are two Arm Cortex-M4 IPU subsystems in the device available for general purpose usage.

Each IPU subsystem includes the following components:

- Two Cortex-M4 CPUs
- Arm®v7E-M and Thumb-2 instruction set architectures
- Hardware division and single-cycle multiplication acceleration
- Dedicated INTC with up to 63 physical interrupt events with 16-level priority
- Two-level memory subsystem hierarchy
  - L1 32-KiB shared cache memory
  - L2 ROM + RAM
    - 64-KiB RAM
    - 16-KiB bootable ROM
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M4

1.3.5 IVA-HD Subsystem

The IVA-HD subsystem is a set of video encoder and decoder hardware accelerators.

The list of supported codecs can be found in the software development kit (SDK) documentation.

1.3.6 Display Subsystem

The display subsystem provides the control signals required to interface the device system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following components:

- **Display controller:** Reads and displays the encoded pixel data stored in memory and writes the output of one of the overlays or one of the pipelines into the system memory. The display controller supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888. It allows selection of the color-depth expansion.
  - Write-back pipeline: Uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 or NV21, and selection of color-depth reduction from RGB24 to RGB16.
  - Up to three LCD outputs, each one with dedicated overlay manager, for support of active matrix color displays (up to 24-bit interface). Maximum listed resolutions are not supported concurrently on all outputs.
    - First main LCD output is delivered on MIPI® DPI 1.0 LCD pixel interface, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
      Note: LCD1 is only available on the AM571x family of devices.
    - Second and third LCD outputs are delivered on MIPI DPI 2.0 LCD pixel interfaces, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
  - One TV output with dedicated overlay manager to support HDMI v1.4a interface (1080p @ 60 fps video and multichannel audio)
  - Own direct memory access (DMA) engine

Copyright © 2015–2019, Texas Instruments Incorporated

- **High-definition multimedia interface (HDMI) encoder** with the following main features:
  - HDMI 1.4a and DVI 1.0 compliant

1.3.7 Video Processing Subsystem

The video processing engine (VPE) module provides support for the following memory-to-memory operations:

- Reads of raster or tiled YUV420 coplanar, YUV422 coplanar, or YUV422 interleaved video
- Deinterlacing up to two 1080i video streams
- Scaling up to 1080p (1920x1080 resolution) of the input video
- Chroma up- and downsampling
- VC-1 Range Mapping and Range Reduction
- Color space conversion
- Writes of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only), or RGB888 (raster only).

1.3.8 Video Capture

There is one Video Input Port (VIP) module in the device, providing video capture functions.

VIP module supports up to:

- Two separate 24-bit video ports for parallel RGB/YUV/RAW (or BT.656/1120) data, up to 165 MHz
- Two separate 8-bit video ports for YUV/RAW (or BT.656) data, up to 165 MHz
- Embedded Sync (multiplexed sources) and Discrete Sync (single source) data interface modes
- Color space conversion and scaling:
  - Up to 2047 pixels wide input with scaling
  - Up to 3840 pixels wide input - when chroma up/down sampling without scaling
  - Up to 4095 pixels wide input - without scaling & chroma up/down sampling
  - Maximum supported input resolution is further limited by:
    - Pixel clock and feature-dependent constraints
    - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels
- Embedded DMA engine, supporting tiled (2D) and raster addressing
- RAW mode for input parallel camera sensor data (up to 24-bit) directly to memory (no conversion or processing)

1.3.9 3D GPU Subsystem

The 3D graphics processing unit (GPU) subsystem is based on POWERVR® SGX544 subsystem from Imagination Technologies. It supports general embedded applications. The GPU can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data.

The GPU subsystem has the following features:

- GPU architecture: one SGX544 core, 64 KiB of system level cache
- Tile-based deferred rendering architecture
- Second-generation universal scalable shader engines (USSE2), multithreaded engines incorporating pixel and vertex shader functionality
- Present and texture load accelerators
  - Enables to move, rotate, twiddle, and scale texture surfaces
  - Supports RGB, ARGB, YUV422, and YUV420 surface formats
  - Supports bilinear upscale
  - Supports source colorkey
- Industry-standard API supports DirectX® 9 and OpenVG™ 1.1

Copyright © 2015–2019, Texas Instruments Incorporated

- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Bilinear, trilinear, anisotropic texture filtering
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture (MMU)

1.3.10 BB2D Subsystem

The 2D BitBlt (BB2D) graphics accelerator subsystem is based on the GC320 core from Vivante Corporation and has the following features:

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw
  - Adobe® Flash®
- BB2D architecture:
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality, 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32 K × 32 K coordinate system

1.3.11 Camera Interface Subsystem

The Camera Interface Subsystem is based on CAL (Camera Adaptation Layer) module and up to two MIPI D-PHY compliant receivers.

CAL provides up to two MIPI CSI-2 interfaces:

- Transfer of pixels and data received by up to two D-PHY receivers (CSI2_PHY1 and CSI2_PHY2) to:
  - System memory, through 128-bit master interface on L3_MAIN interconnect
  - VIP module, through a video port
- **AM571x:**
  - CSI2_PHY1 with 4 data lanes / 1 clock lane
  - CSI2_PHY2 with 2 data lanes / 1 clock lane
- **AM570x:**
  - CSI2_PHY1 with 2 data lanes / 1 clock lane
  - CSI2_PHY2 not supported
- Shared FIFO with 8 KiB size
- Maximum data rate of 1.5 Gbps per data lane
- Data merger for 2-, 3-, or 4-data lane configuration
- Error detection and correction
- Eight contexts to support eight dedicated configurations of virtual channel ID and data types
- On-the-fly differential pulse code modulation (DPCM) decompression

Copyright © 2015–2019, Texas Instruments Incorporated

1.3.12 On-Chip Debug Support

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®)
- Reduction of power consumption in normal operating mode

The debug subsystem includes:

- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Embedded Trace Macro (ETM)
- Trace Port Interface Unit (TPIU)
- Embedded Trace Buffer (ETM)
- Emulation Pin Manager (EPM)
- Cross triggering (XTRIG)

The debug subsystem provides also:

- ICEMelter, for controlling the wake-up and power-down of the emulation power domain
- L3_INSTR CORE instrumentation interconnect
- OCP watch-point (OCP-WP), for monitoring L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Power-management events profiler (PM instrumentation)
- Clock-management events profiler (CM instrumentation)
- Statistics collector (performance probes)

1.3.13 Power, Reset, and Clock Management

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM) with the following features:
  - Dynamic clock gating
  - Dynamic voltage and frequency scaling (DVFS)
  - Dynamic power switching (DPS)
  - Static leakage management (SLM)
- Clock management (CM) for clock generation and distribution, allowing reduction of dynamic consumption.

1.3.14 On-Chip Memory

- The device include one instance of an On-Chip Memory Controller (OCMC) with associated up to 512 KiB RAM with ECC
- Circular buffer feature for each OCMC RAM (8-MiB virtual address space required)
- Save and Restore Memory / Scratch Pad in the wake-up domain

Copyright © 2015–2019, Texas Instruments Incorporated

1.3.15 Memory Management

The memory management is performed from:

- System DMA controller with up to 128 hardware requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO dynamically allocable between active channels.
- Enhanced DMA controller supporting two simultaneous read and two simultaneous write physical channels, and up to 64 programmable logical channels.
- Dynamic memory management (DMM) module, which performs global address translation and address rotation (tiling).
- Two memory management units (MMU), with 4KiB, 64KiB, 1MiB, 16MiB programmable page sizes, and 32 entries TLB.
  - MMU1 dedicated to EDMA
  - MMU2 dedicated to PCIe_SS1

1.3.16 External Memory Interfaces

- One 32-bit DDR3 / DDR3L EMIF controller:
  - Dual-port controller for efficient memory sharing between applications
  - 32-bit data path, single chip-select per memory controller
  - Memory density up to 2 GiB supported on a single chip-select providing a total SDRAM space of 2 GiB addressable by the MPU extended address range
- General-purpose memory controller (GPMC) supporting connection with:
  - Asynchronous SRAM memories
  - Asynchronous and synchronous NOR flash memories
  - NAND flash memories, with up to 16-bit ECC via the Error Location Module (ELM)
  - Pseudo-SRAM devices
- Quad SPI (QSPI) module, supporting 1 to 4 address bytes for SPI NOR flash, and up to 96-MHz single data rate

1.3.17 System and Connectivity Peripherals

The device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources.

1.3.17.1 System Peripherals

- Sixteen general-purpose timers (two timer modules supporting 1-ms tick generation)
- One watchdog timer (WDT)
- One 32-kHz synchronization timer
- System control module, which contains registers for the following functions:
  - Static device configuration
  - Debug and observability
  - Status
  - Pad configuration
  - I/O configuration
  - eFuse logic
  - Analog function control
  - System boot decoding logic
- Thirteen system Mailboxes for communication between MPU, DSP and IPU subsystems.
- SpinLock module for hardware semaphore between the MPU, DSP, and IPU subsystems
- Inter-processor Communication Register

Copyright © 2015–2019, Texas Instruments Incorporated

- Three Pulse Width Modulation Subsystems (PWMSS), each containing Enhanced High Resolution Pulse Width Modulator (eHRPWM), Enhanced Capture (eCAP), and Enhanced Quadrature Encoded Pulse (eQEP) modules.
- Real-Time-Clock Subsystem (RTCSS), supporting four external wake-up inputs and one power enable output, all of which are 3.3- or 1.8-V multivoltage I/Os.
  Note: RTC is only available on the AM571x family of devices
- Eight general-purpose input/output (GPIO) modules with up to 32 I/Os each. One GPIO module supporting wake-up request generation.
- HDQ™/1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Keyboard controller, supporting up to 9 × 9 matrix keypads

1.3.17.2 Media Connectivity Peripherals

- Four HS-MMC/SD/SDIO modules:
  - Two modules acting as HS-MMC/SD initiator controllers, supporting JEDEC JESD84 v4.5-A441 and SD3.0 physical layer with SDA3.00 standards
    - One controller with 8-bit interface for JESD84 memories with dual voltage IOs (1.8 or 3.3 V). Another controller with 4-bit interface for external card support with embedded dual voltage I/Os (1.8 or 3 V) and supporting UHS-I rates.
    - Each controller including its DMA controller compliant to ADMA2 (SDA3.00 Part A2 DMA controller)
  - Two modules acting as SDIO interface controllers. One controller supporting 4-bit data bus width. Another controller supporting up to 8-bit data bus width.
- One SuperSpeed Universal Serial Bus (USB) Dual-Role-Device (DRD) subsystem with embedded HS and SS PHYs, compatible with the USB2.0 (up to 480 Mbps) and USB3.0 (5 Gbps) standards
- One HS USB subsystem with embedded HS PHY, supporting up to 480 Mbps.
- One SATA subsystem, providing interface for solid-state drive (SSD) or hard-disk drive (HDD) mass storage. Supports one HBA port with SATA-2 generation speed of 3 Gbps.
  Note: SATA is only available on the AM571x family of devices

1.3.17.3 Connectivity Peripherals

- One 3-port Gigabit Ethernet Switch subsystem (10, 100, or 1000 Mbps). The switch provides two external Ethernet ports and one internal CPPI interface port with AVB/Industrial Ethernet and 802.1ae support. Included support for 3.3-V RMII/MII and 1.8- or 3.3-V RGMII.
- Two DCAN controllers, supporting bitrates up to 1 Mbit/s and compliant to the Controller Area Network (CAN) 2.0B protocol specification.
- Two PCI Express subsystems, one providing Gen2 compliant 2-lane port, and the other providing Gen2 compliant 1-lane port, up to 5.0 Gbps per lane. Both PCIe subsystems provide support for either Root Complex or Endpoint. The two PCIe subsystems share common 2-lane PCIe PHY, configurable to operate either as 2-lane to one controller (PCIe_SS1) or two separate lanes to two controllers (PCIe_SS1 and PCIe_SS2).

1.3.17.4 Audio Connectivity Peripherals

- Eight multichannel audio serial ports (McASP):
  - Two McASP supporting up to 16 channels each and independent TX/RX clock/sync domains
  - Six McASP supporting up to 4 channels each and unified clock/sync domain
  - Features list of the McASP include:
    - Independent transmit and receive modules, each including programmable clock and frame sync generator, TDM streams from 2 to 32, support for time slot sizes up to 32 bits, data formatter for bit manipulation
    - Glueless connection to audio analog-to-digital converters (ADC), digital-to-analog converters (DAC), codec, digital audio interface receiver (DIR), and S/PDIF transmit physical layer components.

Copyright © 2015–2019, Texas Instruments Incorporated

- Wide variety of I2S and similar bit-stream formats
- Integrated digital audio interface transmitter (DIT) supporting S/PDIF, IEC60958-1, AES-3 formats, and enhanced channel status/user data RAM
- 384-slot TDM with external digital audio interface receiver (DIR) device
- Extensive error checking and recovery

1.3.17.5 Serial Control Peripherals

- Ten universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces, 16C750 compatible.
  - One UART module supporting extended modem control signals
  - One UART module with IrDA features
- Four general purpose multichannel serial peripheral interface (McSPI) modules
- Five multimaster HS I^2C controller modules, compliant with Philips I^2C specification version 2.1.
  - I2C1 and I2C2 controllers support Fast-mode, with rates up to 400 Kbps
  - I2C3, I2C4 and I2C5 controllers support High-speed mode, with rates up to 3.4 Mbps

Copyright © 2015–2019, Texas Instruments Incorporated

1.4 AM571x, AM570x Family

The AM571x family is composed of several device variants (that is AM5718, AM5716, etc.). The supported set of features and peripherals is device part number dependent. Refer to a device-specific Data Manual, for more information.

The AM570x family is composed of several device variants (that is AM5708, AM5706, etc.). The supported set of features and peripherals is device part number dependent. Refer to a device-specific Data Manual, for more information.

1.5 AM571x, AM570x Device Identification

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in Table 1-2 and Table 1-4. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

Table 1-1. Device Identification Register Fields

Register Field	Alias Name	Physical Address	Address Offset
CTRL_CORE_STATUS[8:6] DEVICE_TYPE	DEVICE_TYPE	0x4A00 2134	0x134
CTRL_WKUP_STD_FUSE_DIE_ID_0[31:0] STD_FUSE_DIE_ID_0	DIE_ID[31:0]	0x4AE0 C200	0x200
CTRL_WKUP_ID_CODE[31:0] STD_FUSE_IDCODE	ID_CODE	0x4AE0 C204	0x204

1.6 AM571x, AM570x Package Characteristics Overview

The AM571x die will be offered with the following characteristics:

- Package type:
  - Body: 23 × 23mm
  - Technology: Ball Grid Array (BGA) package
  - Ball pitch: 0.8-mm ball pitch
  - Pattern: partial grid
  - Pins: 760 total device pins

The AM570x die will be offered with the following characteristics:

- Package type:
  - Body: 17 × 17mm
  - Technology: Ball Grid Array (BGA) package
  - Ball pitch: 0.65-mm ball pitch
  - Pattern: partial grid
  - Pins: 538 total device pins

For more information, refer to device-specific Data Manual.

2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GiB space divided into several regions, depending on the target type.

The memory map has the following features that are shared among the initiators, such as the MPU subsystem:

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IPU/DSP subsystem

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR and NAND flash and static random access memories (SRAMs). The DMM is used for synchronous dynamic random access memories (SDRAMs), such as DDR. For more information, see Section 15.2, *Dynamic Memory Manager*, and Section 15.3, *EMIF Controller*.

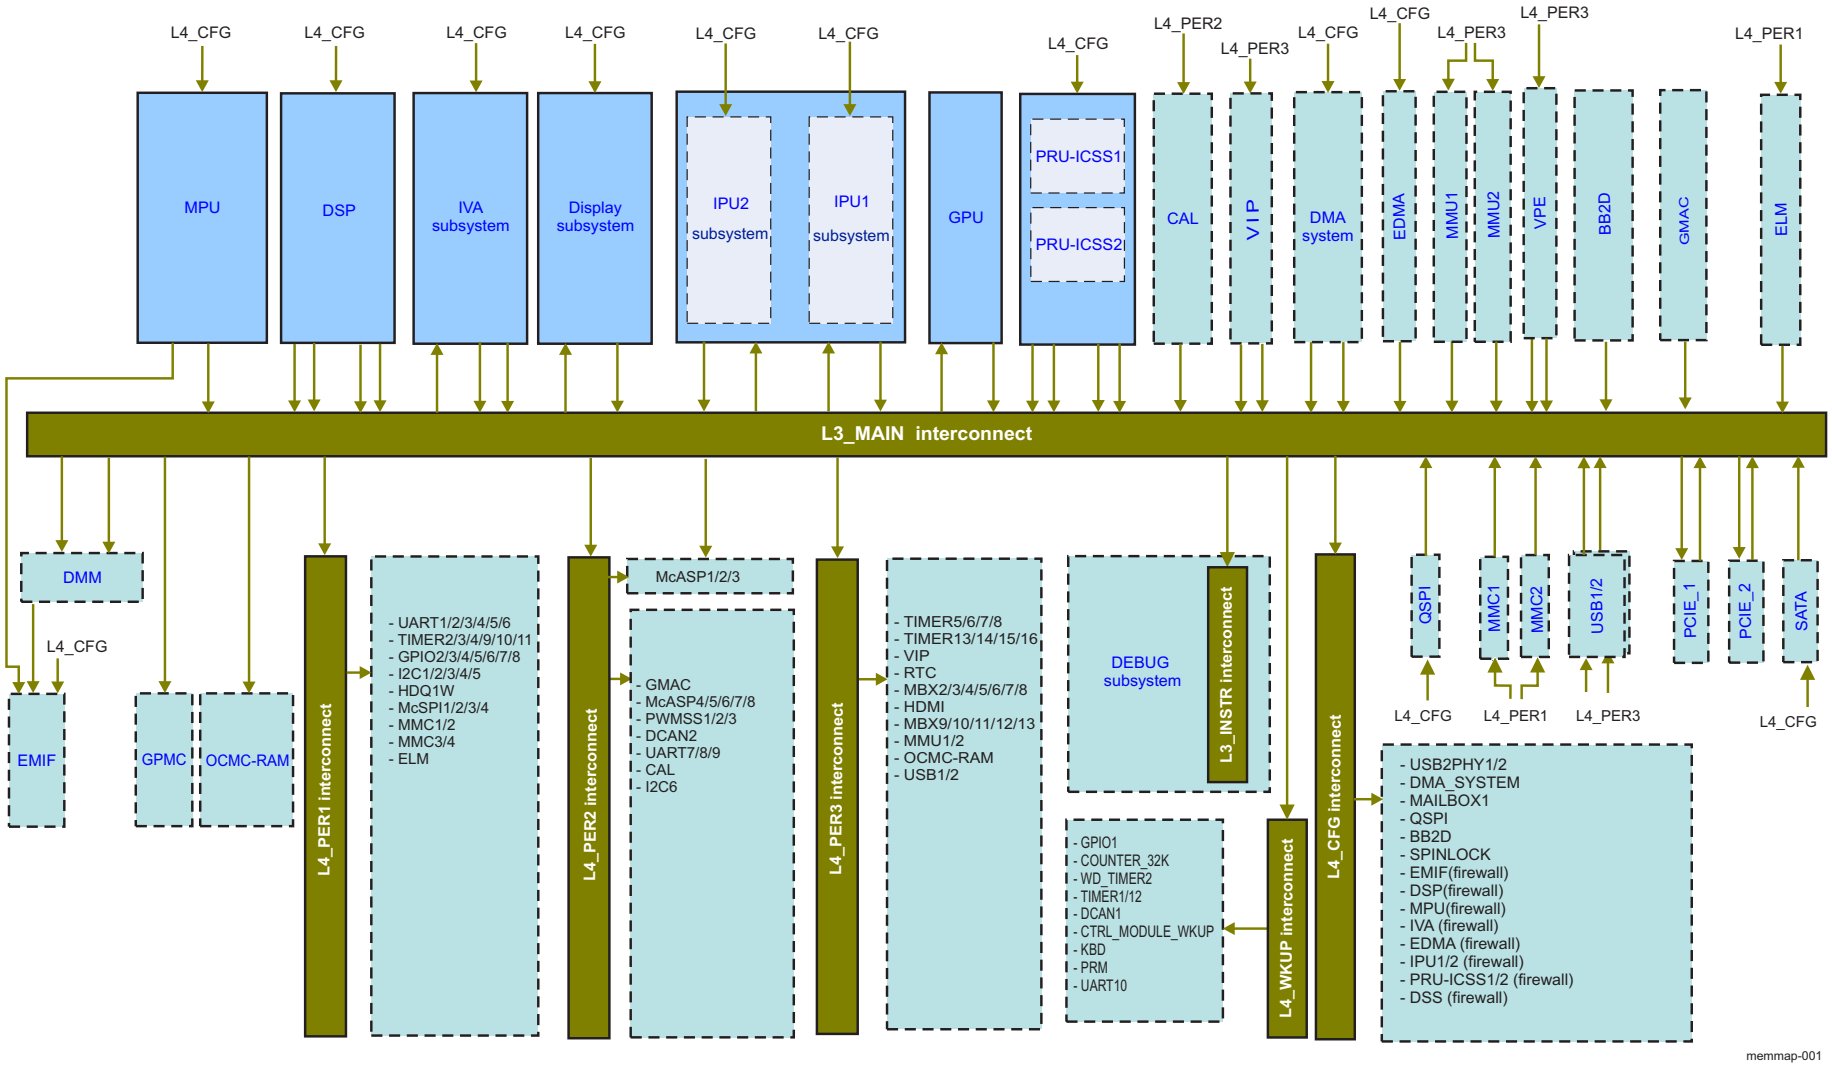
The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see Section 14.2, *L3 Interconnect*, and Section 14.3, *L4 Interconnect*.

Figure 2-1 shows the interconnect of the device and the main modules and subsystems in the platform.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 2-1. Interconnect Overview



NOTE: ATL, VCP1, VCP2, MLB, and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

Additionally, RTC and SATA are not supported on the AM570x family of devices.

2.2 L3_MAIN Memory Map

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3_MAIN, and L4. L1 and L2 are memories in the MPU, IPU, and digital signal processor (DSP) subsystems. L3_MAIN handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3_MAIN and five L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3_MAIN interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GiB address space (the total low-address space is 4GiB, 32-bit). The CPU extended address range is labeled as high memory (Q8–Q15) and provides a total of 8GiB.
- L2: Each quarter is divided into eight blocks of 32MiB, with target spaces mapped in the blocks.

This organization allows the decoding of all target spaces based on the 7 most significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

  When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the lowest 1-MiB memory space [0x0000 0000 – 0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000–0x400F FFFF].

  When booting from the GPMC, the memory space is part of the GPMC address space. At reset, the 0x0000 0000 address is available on chip select 0 (CS0) for a memory size of 16MiB.

  For more information about the sys_boot pins configuration, see Section 15.4, *General-Purpose Memory Controller*, and Chapter 33, *Initialization*.
- GPMC space:

  Eight independent GPMC chip selects (CS0 to CS7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip selects have a programmable start address and programmable size (up to 128MiB) in a total memory space of (Q0) 1GiB, but limited now to 512MiB.
- EMIF space:

  Q2 addressing space covers a 1-GiB address space on a single CS line.

  Q3 addressing space covers a 1-GiB address space on a single CS line.
- TILER space:

  Q3 addressing space is also used to access the TILER system. This space is visible only for the display subsystem (DSS) and camera adaptation layer (CAL). See Table 2-12.
- 8GiB of SDRAM virtualization:

  This high address range (Q8–Q15) requires an address greater than 32 bits. This space is visible only for the MPU subsystem. See Table 2-8.

Table 2-1 describes the global memory map.

Table 2-1. L3_MAIN Memory Map

Quarter	Region Name	Start_address (hex)	End_address (hex)	Size	Description
Q0 (1GiB)	GPMC[1]	0x0000 0000	0x1FFF FFFF	512MiB	8/16 Ex[2]/R/W
	PCIE_SS1	0x2000 0000	0x2FFF FFFF	256MiB	PCIe_SS1 configuration space
	PCIE_SS2	0x3000 0000	0x3FFF FFFF	256MiB	PCIe_SS2 configuration space
Q1 (1GiB)	Reserved	0x4000 0000	0x402F FFFF	3MiB	Reserved
	OCMC_RAM1	0x4030 0000	0x4037 FFFF	512KiB	32-bit Ex[2]/R/W

(1) Boot space location depends on the external sys_boot [5:0] pins.
(2) Ex = Executable

2.3 L4 Memory Map

The L4 interconnects handle transfers with peripherals. The L4 interconnect comprises the following interconnects:

- L4_CFG
- L4_WKUP
- L4_PER1
- L4_PER2
- L4_PER3

The L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Map

The L4_CFG interconnect is a 12-MiB space composed of the L4_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

Table 2-3. L4_CFG Memory Map

2.3.2 L4_WKUP Memory Map

The L4_WKUP interconnect is a 256-KiB space composed of the L4_WKUP interconnect configuration registers and the module registers.

Table 2-4 describes the mapping of the registers for the L4_WKUP interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_WKUP interconnect. All other accesses are internal to the L4_WKUP interconnect.

Table 2-4. L4_WKUP Memory Map

2.3.3 L4_PER Memory Map

The L4_PER interconnect has three memory spaces:

- L4_PER1 memory space (see Table 2-5)
- L4_PER2 memory space (see Table 2-6)
- L4_PER3 memory space (see Table 2-7)

The L4_PER interconnects are composed of the L4_PER interconnect confguration registers and the module registers.

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_PER interconnects. All other accesses are internal to the L4_PER interconnects.

2.3.3.1 L4_PER1 Memory Map

Table 2-5 describes the mapping of the registers for the L4_PER1 interconnect.

2.5 IPU Memory Map

The device implements two IPU subsystems (IPU1 and IPU2). For more information about IPU, see Chapter 7.

Table 2-9 describes the IPU memory mapping.

NOTE: Some of the system (L3) resources, such as EVE and EDMA, are not directly accessible by IPU, as they are overlapping with IPU's own resources in its memory space. In such cases, software must properly configure IPU AMMU / L2 MMU so that IPU can access these system resources.

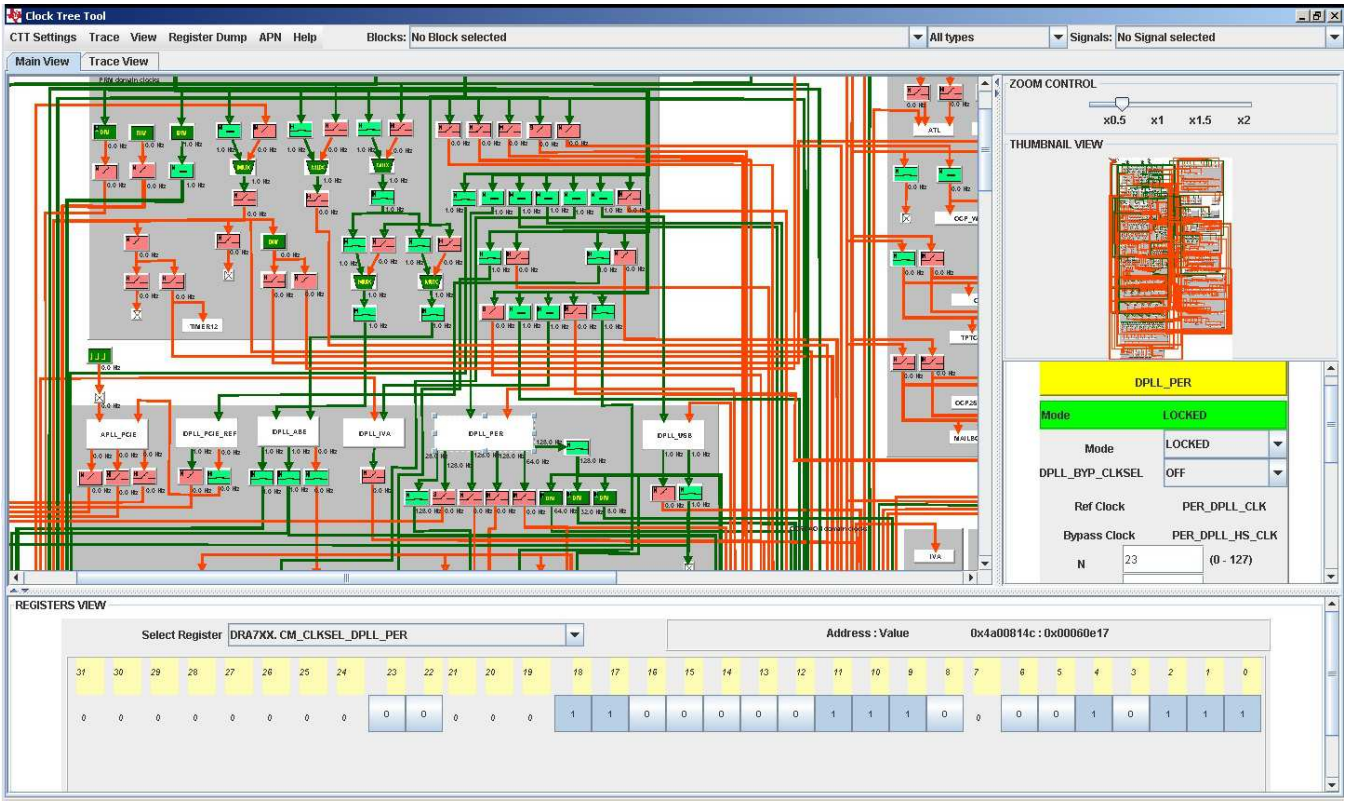
For a detailed visual representation of the distribution and management of the device clocks at the PRCM level, see the clock device interactive software for the device CLOCKTREETOOL-SITARA CLOCKTREETOOL-AUTOMOTIVE.

Figure 3-1. Clock Tree Tool (CTT)



prcm-095

The Clock Tree Tool (CTT) is a Java™-based, stand-alone application. The CTT is interactive clock tree configuration software for the device. The CTT lets the user:

- Visualize the device clock tree
- Interact with clock tree elements and view the effect on PRCM registers
- Interact with the PRCM registers and view the effect on the device clock tree
- View a trace of all the device registers affected by the user interaction with clock tree
- Extract registers and register dumps for Code Composer Studio and Lauterbach

The advantage of the CTT is that the user can visualize the clock tree state of the device on power-on reset and then customize the configuration of the clock tree for the specific use case and identify the device register settings associated to that configuration. Furthermore, the user can dump and read in register settings for the specific scenarios.

Being an interactive visual tool, the CTT gives the user a global view of the device clock tree architecture and allows determining the exact register settings to obtain the specific configuration.

3.1 Device Power Management Introduction

Power management is one of the most important design aspects of any system.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

NOTE: RTC low-power mode is not supported on the AM571x / AM570x family of devices.

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture that supports multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term <*module*> is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

3.1.1.1 Clock Management

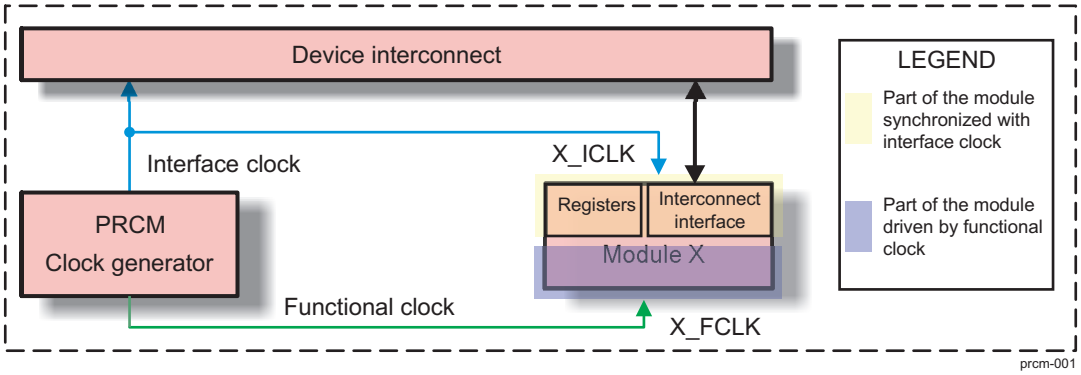
The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see Figure 3-2).

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-2. Functional and Interface Clocks



The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an _ICLK suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an _FCLK suffix.

Some clocks are qualified as permanent clocks. They are functional clocks, that can stay active while the corresponding entity manages them.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM module functional clock output or a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or they may be gated. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol

Copyright © 2015–2019, Texas Instruments Incorporated

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for that purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the <*Module*>_SYSCONFIG. MIDLEMODE or <*Module*>_SYSCONFIG. STANDBYMODE bit fields, as described in Table 3-1. The behavior, identified in the STANDBYMODE Bit Value column, must be configured.

Table 3-1. Master Module Standby Mode Settings

STANDBYMODE Bit Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wake-up-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

NOTE:

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in Table 3-1. See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x]. STBYST bit in the PRCM module. Table 3-2 describes the master module standby status.

Table 3-2. Master Module Standby Status

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

Table 3-3 lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Master module standby request is deasserted.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-3. Master Module Clock Enabling Conditions (continued)

Relation		Condition
		Master module wake-up request is asserted.

Slave idle protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an IDLE request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module, and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or because the slave module receives a wake-up event (for example, an interrupt or a direct memory access [DMA] request). In this situation the PRCM module enables the clocks for the module, and then signals the module to wake up by deasserting the IDLE request.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the <*Module*>_SYSCONFIG. SIDLEMODE or <*Module*>_SYSCONFIG. IDLEMODE bit field, as described in Table 3-4. The behavior, identified in the IDLEMODE Bit Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

IDLEMODE Bit Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any IDLE request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wake-up-capable mode	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module swakeup output(s) is implemented.

NOTE:

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in Table 3-4. See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x] IDLEST bit field in the PRCM module. Table 3-5 lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-5. Slave Module Idle Status (continued)

IDLEST Bit Value	Idle Status	Description
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the IDLE request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the <*Module*>_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine the part of the module on which the conditions to acknowledge the PRCM module IDLE request are tested. As an example, if the functional clock must remain active when the module is in idle mode, the module must acknowledge a PRCM module IDLE request by considering only the interface clock gating conditions (that is, there is no pending activity on the interconnect).

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. Table 3-6 describes the possible CLOCKACTIVITY settings for a module.

Table 3-6. Slave Module Clock Activity Settings

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgment. This setting also means both clocks may be gated upon a PRCM module IDLE request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the IDLE request without checking the internal functions linked to its clocks.

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in Table 3-6.

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

Copyright © 2015–2019, Texas Instruments Incorporated

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure consistent programming between the CLOCKACTIVITY settings of the module and the clock-gating control bits in the PRCM module. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM_<Clock domain>_<module>_CLKCTRL[1:0] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the IDLE request to the module unconditionally (that is, immediately when software requests) or through hardware control when the module idle conditions are satisfied. Table 3-7 describes the configurable behavior of MODULEMODE.

Table 3-7. Slave Module Mode Settings in PRCM

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module IDLE request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can react only to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).
0x1	Auto	This mode applies to a module when the PRCM module manages only its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	Not available

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM_<Clock domain>_<module>_CLKCTRL[1:0] MODULEMODE bit field description for the module to identify the supported settings.

NOTE: Modules, which can be configured with DISABLED or AUTO values of ModuleMode, cannot go from IDLE to DISABLED state if ModuleMode is changed from AUTO to DISABLED while module is in IDLE state. Once the CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW_WKUP, then SW has to poll for PM_<Clock_domain>_PWRSTST[1:0] PowerStateSt = 0x03 and PM_<Clock_domain>_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-8. Slave Module Interface Clock Enabling Conditions (continued)

Relation		Condition
		Slave module wake-up request is asserted.

Table 3-9. Slave Module Functional Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module idle status is 0x2 (interface clock is idled).
		Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more that one module. Clock-enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Module wake-up request

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This can be the result of an external request (for example, to the input/output [I/O] port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WD_TIMER time up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock-domain level, as explained in Section 3.1.1.1.3, *Clock Domain*.

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see Figure 3-3). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] state). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to activate and gate individually each device clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-3. Generic Clock Domain

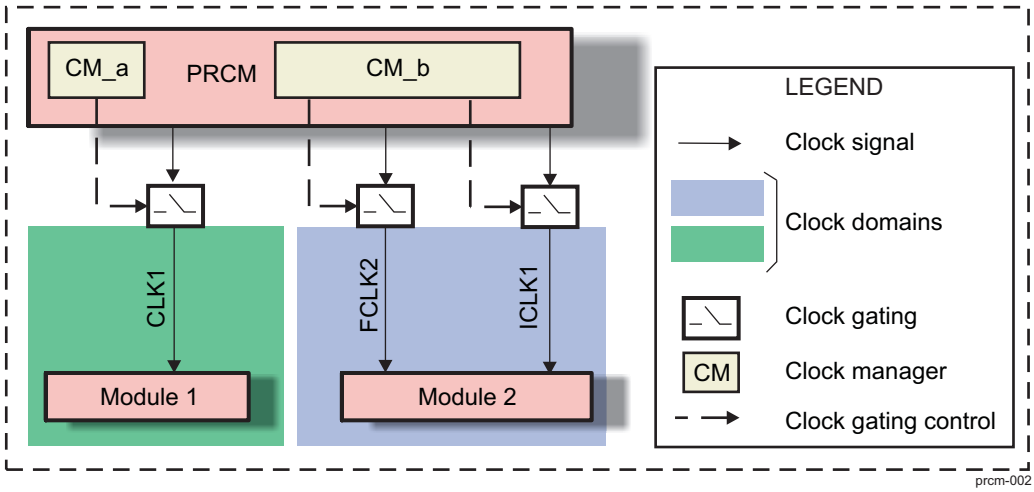


Figure 3-3 is an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks, a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock domain>_CLKSTCTRL[x] CLKACTIVITY_FCLK/<Clock name>_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

Table 3-10. Clock Domain Functional Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

Table 3-11. Clock Domain Interface Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The interface clock of the clock domain is inactive.
0x1	Active	The interface clock of the clock domain is running.

All Clock Domains are summarized and described in Section 3.6.4, *Clock Domains.*

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION (IDLEREQ), and INACTIVE (IDLE). Figure 3-4 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-4. Clock Domain State Transitions

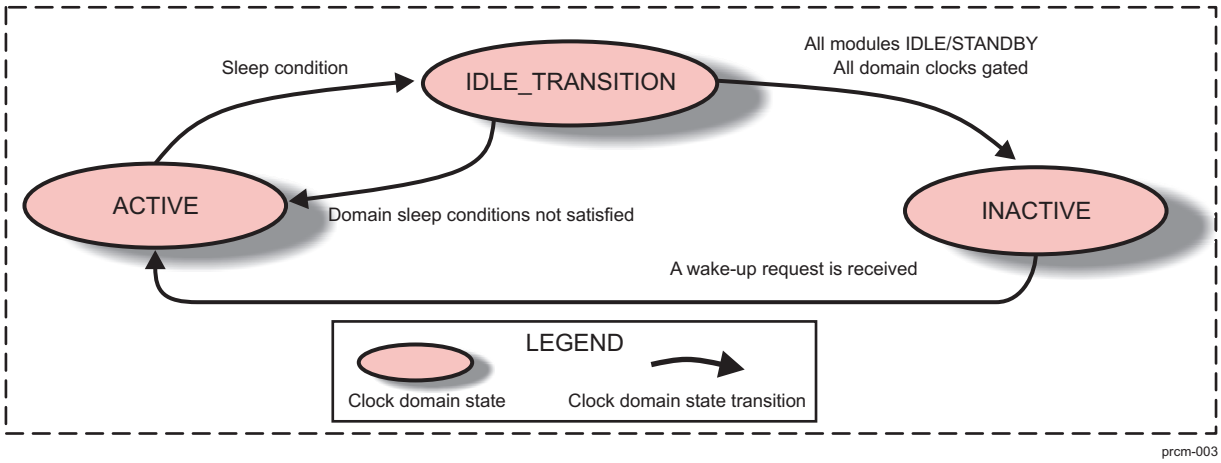

Table 3-12 defines the clock domain states.

Table 3-12. Clock Domain Clock States

State	Description
ACTIVE	• Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. • All mandatory functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. • All interface clocks to the nondisabled slave modules in the clock domain are provided. • All mandatory functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. • Every enabled optional clock to the modules in the clock domain is provided.
IDLE_TRANSITION	This is a transitory state. • Every master module in the clock domain is in STANDBY state. • Every IDLE request to all the slave modules in the clock domain is asserted. • The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. • Every enabled optional clock to the modules in the clock domain is provided.
INACTIVE	All clocks within the clock domain are gated. • Every slave module in the clock domain (that is, those whose MODULEMODE value is set to disabled or auto) is in IDLE state and set to disabled or auto mode. • Every master module in the clock domain is in STANDBY state. • Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-13 describes the clock transition mode settings of the clock domain.

Table 3-13. Clock Domain Clock Transition Mode Settings

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, regardless of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-15).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, regardless of the hardware conditions identified in Table 3-14.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-13. Clock Domain Clock Transition Mode Settings (continued)

CLKTRCTRL Bit Value	Selected Mode	Description
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-14 and Table 3-15).

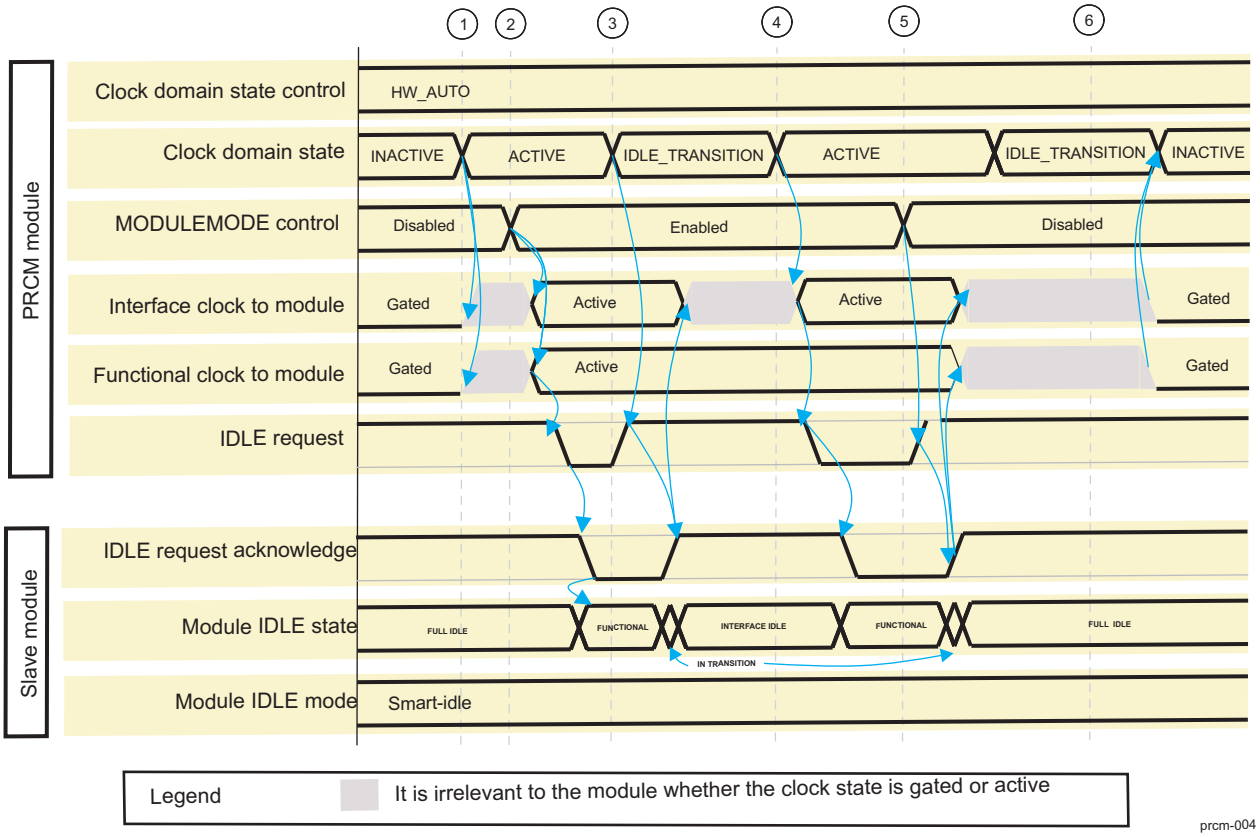
NOTE: Depending on its characteristics, a clock domain may or may not support all the clock transition mode settings described in Table 3-13. See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in Figure 3-5 through Figure 3-7 identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They show the changes in the state of the module based on the changes to the clock domain state and module mode settings.

Figure 3-5 shows the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: disabled and enabled.

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 1



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is still disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. Software changes the module mode to ENABLED. The clocks to the module are automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The

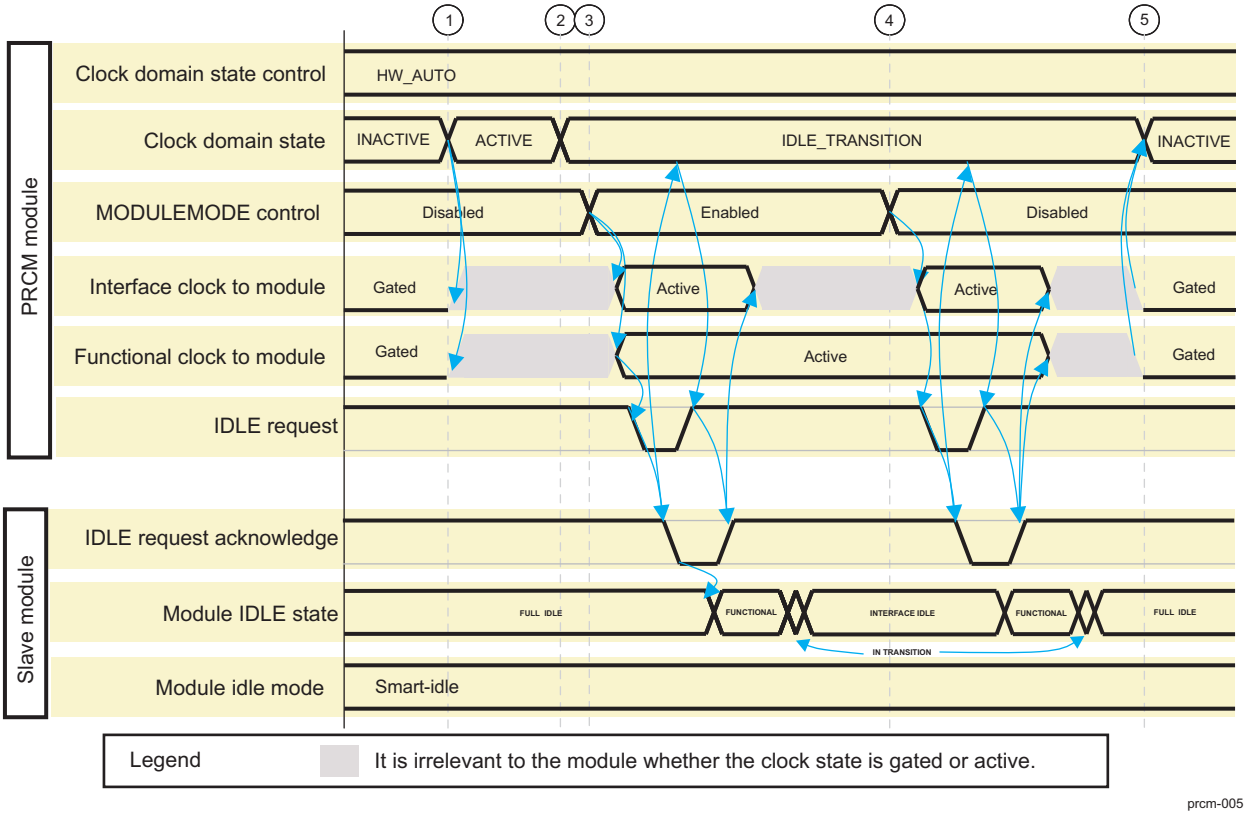
Copyright © 2015–2019, Texas Instruments Incorporated

module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional.

3. The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled because the module is in enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to IDLE_TRANSITION state. When the sleep transition conditions of the clock domain are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-6 shows the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE_TRANSITION.

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 2



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE_TRANSITION state. Because the module mode control is disabled, this event has no effect on the module state.
3. Software changes the module mode to ENABLED. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is

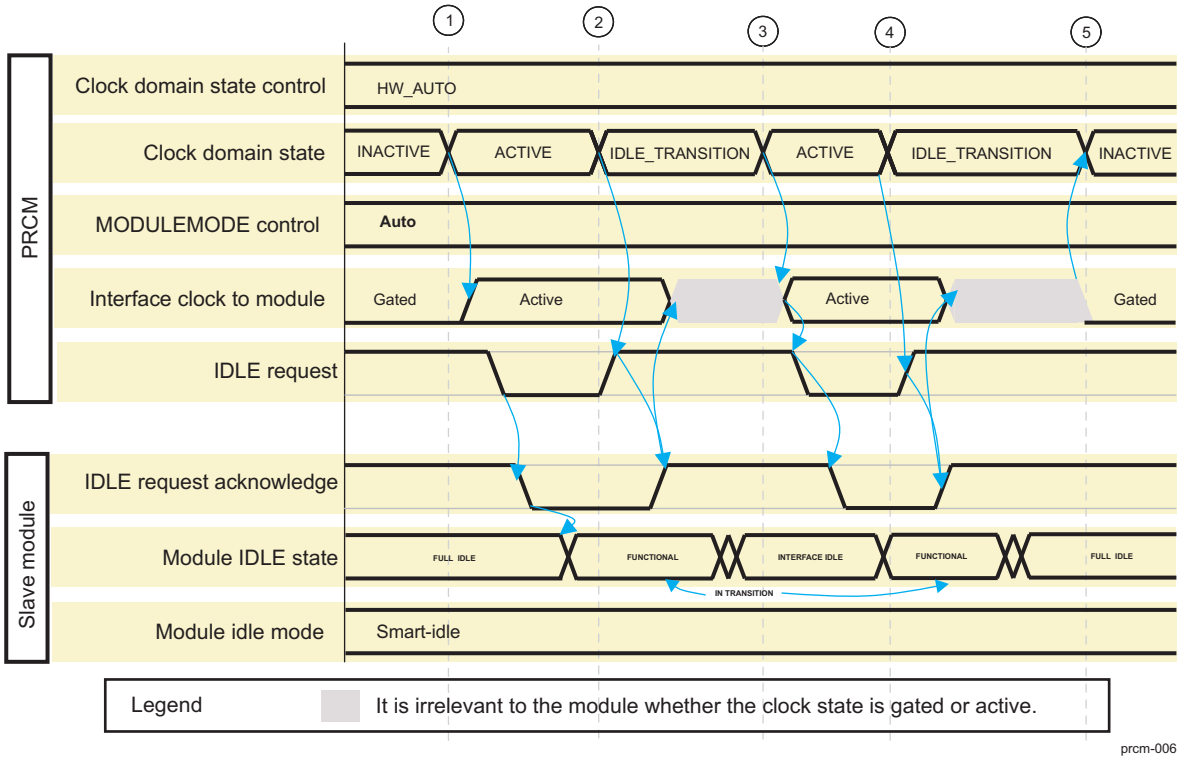
Copyright © 2015–2019, Texas Instruments Incorporated

requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.

4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go out of IDLE state by asserting the IDLE request signal. As IDLE request acknowledge is de-asseted, PRCM set back the module to IDLE state. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-7 shows the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

Figure 3-7. Clock Domain/Slave Module Clock-Management Interaction Sequence 3



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes its state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake; that is, the module IDLE state is functional.
2. The clock domain switches to IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module goes out of IDLE state.
4. This step is the same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

Copyright © 2015–2019, Texas Instruments Incorporated

3.1.1.1.6 Clock Domain Sleep/Wake-up

The clock domain manager initiates a domain wake-up transition when the conditions listed in Table 3-14 are satisfied.

Table 3-14. Clock Domain Wake-Up Conditions

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2).
	At least one wake-up request is asserted by one of the modules of the clock domain.
	At least one dynamic dependency(1) from another clock domain is active.
	At least one static dependency(1) from another clock domain is active.
	At least one wake-up dependency(1) from a module in another clock domain is active.

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

The clock domain manager initiates a domain sleep transition when the conditions listed in Table 3-15 are satisfied.

Table 3-15. Clock Domain Sleep Conditions

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency(1) from any other domain is active.
		No wake-up dependency(1) from any module in another domain is active.
		No static domain dependency(1) from any other domain is active.
	OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
		The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

Dependency between two clock domains can also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain can support the types of clock domain dependencies described in the following sections.

Table 3-16 and Table 3-17 detail all the domain dependencies:

- **NA/NA**: if no dependency can exist because no corresponding interconnect path exists in the device
- When cell is different than NA/NA, the cell contains two attributes:
  - First attribute for the presence and control method of a static dependency:
    - **SW**: Static dependency is controlled by a software bit. This is the most generic way of control. Depending on the use case and on latency requirement for accessing target domain, software can enable or not the static dependency. When not enabled, access to those domains is performed using dynamic dependencies.
    - **1**: Static dependency is always enabled (hard-wired). This is relevant for a domain that has an "exact standby" system initiator with the target domain being the domain containing the interconnect module to which the initiator is connected.
    - **0**: Static dependency is never enabled (hard-wired). This is relevant for domains that do not have strong access latency requirements, or for which a static dependency is not desired for

Copyright © 2015–2019, Texas Instruments Incorporated

specific reasons (for example, dependencies with emulation domain). Access to those domains is performed using dynamic dependencies.

- **NA**: Nonapplicable (means domain has no system initiator able to access the other domain)

– Second attribute for the presence and control method of a dynamic dependency:

- **1..n**: Dynamic dependency is always enabled (hard-wired). The number of corresponding interconnect interfaces is also specified. This is relevant for most of the domain-to-domain direct interconnect connection.
- **0**: Dynamic dependency is never enabled (hard-wired). This is relevant only when a static dependency is always enabled between same domains, or when the target domain cannot support the wakeup on access feature.
- **NA**: Nonapplicable (means that both domains are not directly linked by an OCP interface)

When a static dependency is hardware-coded between two domains directly linked by one or several interconnect interfaces, then the corresponding dynamic dependency is useless.

Emulation domain (DAP initiator) has no static dependency with any other domain. It has, however, a dynamic dependency with the L3_MAIN2 interconnect. A domain that can access an emulation domain does not have static or dynamic dependency with it.

Domain dependencies are chosen such that any access (even from EMU/DAP) towards a nondisabled target is always completed normally. Using static dependencies allows having minimal access latencies by keeping necessary domains on whenever the initiator is not standby. This may be at the expense of additional power consumption because some domains may stay on while not in use for a long time. By disabling static dependencies, applicative access is still completed normally by waking up, if applicable, the necessary domain on the path from the initiator to the target. Power consumption can be optimized at the expense of additional access latencies.

NOTE: Once the CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW_WKUP, then SW has to poll for PM_<Clock_domain>_PWRSTST[1:0] PowerStateSt = 0x03 and PM_<Clock_domain>_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

Copyright © 2015–2019, Texas Instruments Incorporated

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from a domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_MAIN1 because this domain has a level 3 (L3) interconnect to carry the transactions from the digital signal processor (DSP) module.

This static dependency consists of forcing clock domain B to stay active as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM_<Source Clock domain>_STATICDEP[x] <Destination Clock domain>_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

The destination domain must be put into forced wake-up (CM_<X>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if there has not been transactions from clock domain A to clock domain B, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled level 4 (L4) clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

Prescaled clock frequency = L4 interface clock frequency / (PRESCAL + 1)

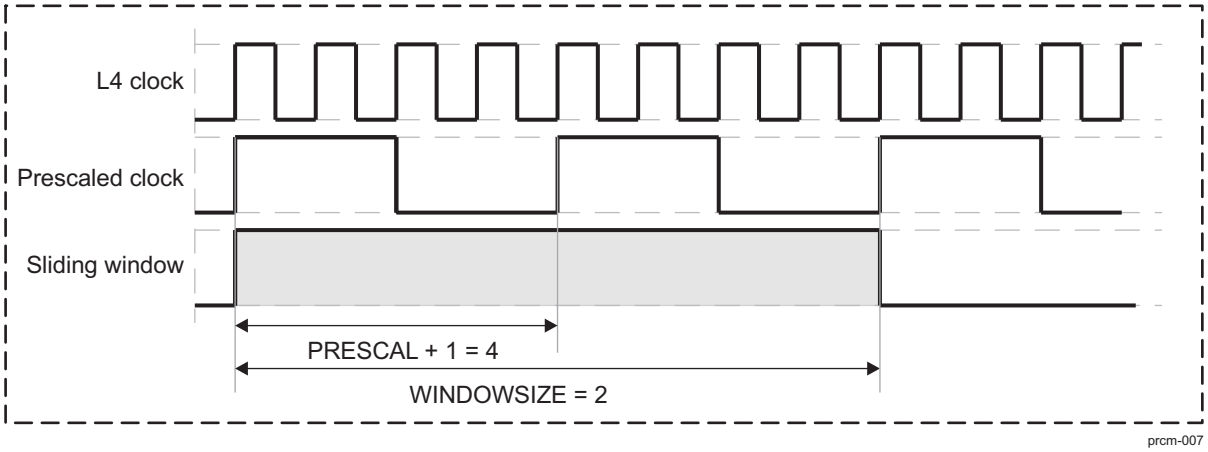
The size of the sliding window is fixed by setting the CM_<Clock domain>_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

Sliding window duration = WINDOWSIZE × Period of Prescaled clock cycle

Figure 3-8 is an example of the sliding window duration equal to eight clock cycles of an L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-8. Sliding Window for Dynamic Dependency



This dynamic dependency is also referred to as the autosleep/autowakeup feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when both of the following conditions are met:

- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, a dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_<Source Clock domain>_DYNAMICDEP[x] <Destination Clock domain>_DYNDEP bit.

NOTE: It is recommended to use dynamic dependencies. They give better power results. Static dependencies should be rarely used (in some cases they can be used as they give shorter latency for a system initiator to access slave).

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module activates not only its clock domain but also the clock domain of the servicing module.

NOTE: To ensure that the clock domain of the servicing module remains active, the wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains, but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be either of following types:

- Interrupt request to the microprocessor unit (MPU), DSP, or image processor unit (IPU) interrupt controller (INTC)

Copyright © 2015–2019, Texas Instruments Incorporated

- DMA request to a DMA controller

Upon wake-up by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, IPU, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between the servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not affected by its wake-up dependency settings. For master modules, the static dependencies are not affected.

Hence, in addition to the activation of the clock domains previously described, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the wake-up clock domain through dynamic dependencies are activated only if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_<Power domain>_<Originator Module> _WKDEP[x] WKUPDEP_<Originator Module>_[IRQ/DMA]_<Servicing Module> bit of the PRCM module, where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. Servicing Module refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the wake-up dependency (WKUPDEP) for the module clock domain is not configurable and may be hardwired in the PRCM module.

For the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

3.1.1.2 Power Management

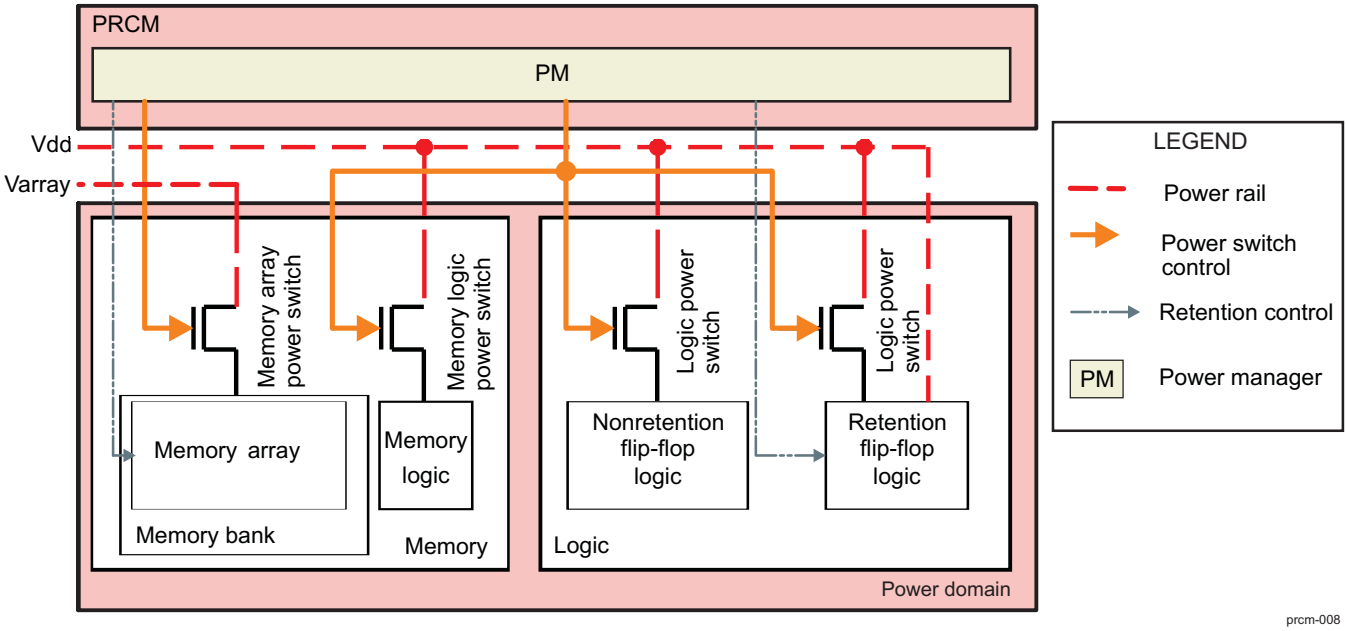
The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device lets the PRCM module turn on and off specific sections of the device without affecting other sections.

3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure 3-9). A power domain can be turned on and off without affecting other parts of the device.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-9. Generic Power Domain



To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into logic and memory areas.

The memory area contains two entities:

- Memory bank: Composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches).
- Memory logic: Powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches)

The logic area in the power domain can also be split between retention flip-flops (RFFs) and nonretention flip-flops (DFFs).

Table 3-18 lists the possible states and substates of the logic area in a power domain.

Table 3-18. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.
OFF		Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state.

RETENTION state is useful for quickly switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state, power consumption is less than in ON power state.

Similarly, in RETENTION state the CSWR state has the advantage of faster turn-on times and higher leakage currents.

Copyright © 2015–2019, Texas Instruments Incorporated

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate power state changes of the memory array when the associated power domain is in ON power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states listed in Table 3-19.

Table 3-19. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention through an applicable direct retention control signal. Data in memory are always retained.
OFF	The memory array is powered down. Data in memory are lost.

3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic or memory areas, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_<Clock Domain Name>_<Module Name>_CONTEXT register provides the status of the device logic and memory context.

- The module logic context consists of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context consists of: only RFFs, only DFFs or both RFFs and DFFs.

NOTE: The display subsystem is an exception where the status of DFF and RFF context is given, because only HMDI keys are retained, while most of the display subsystem is not retained.

These context status bits must be cleared by software.

3.1.1.2.3 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to CSWR RETENTION state).

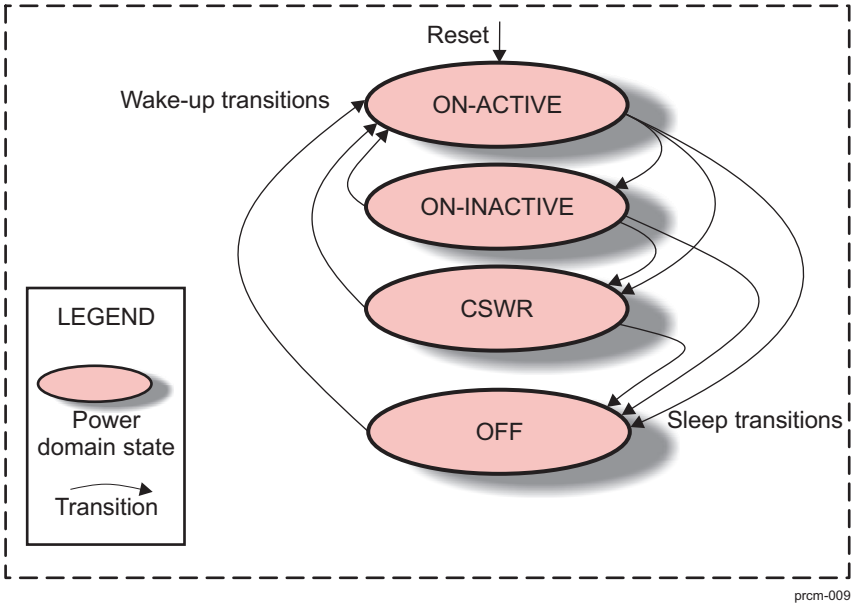
The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in IDLE state.

Figure 3-10 shows all possible power domain state transitions.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-10. Power Domain Transitions



Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF and LOWPOWERSTATECHANGE, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE, CSWR or OFF) to ON-ACTIVE state is always direct.

The power domain manager initiates a power domain wake-up transition when the conditions listed in Table 3-20 are satisfied.

Table 3-20. Power Domain Wake-Up Conditions

Relation		Condition
AND		Voltage domain is on.
	OR	There is at least a wake-up condition for one enclosed functional clock domain.
		There is a request for clock generation or distribution enclosed in the power domain.
		There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in Table 3-21 are satisfied.

Table 3-21. Power Domain Sleep Conditions

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

Table 3-22 lists the control and status features of the PRCM module power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-22. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper low-power state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the power domain logic is in CSWR RETENTION state when the domain transitions to RETENTION state
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON, or RETENTION state when the power domain is in RETENTION state. The memory bank cannot be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in ON, RETENTION or OFF state when the power domain is in ON state
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power state transition in the power domain is in progress or there is no ongoing transition
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON.
PM_<Power domain>_PWRSTST[25:24] LASTPOWERSTATEENTERED	Status	Identifies the last (previous) power state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.

3.1.1.3 Voltage Management

The PRCM module do not provide controls over the Voltage management. All OPP changes will be handled by Application software directly without any PRCM intervention.

3.1.1.3.1 Voltage Domain

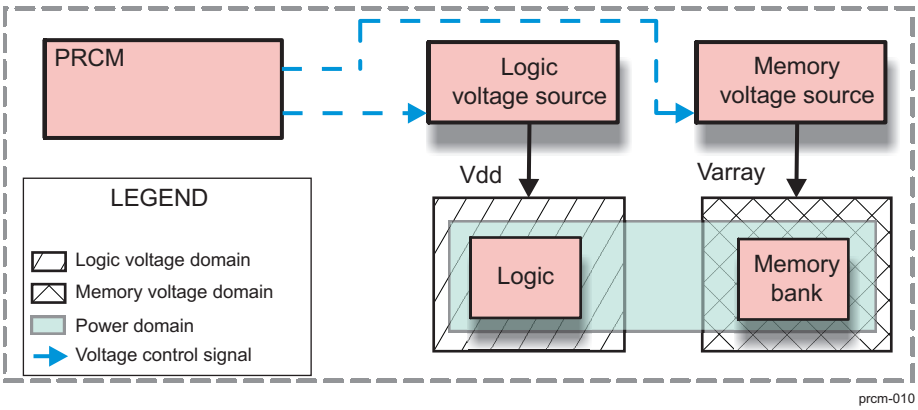
A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDOs or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module.

The voltage managers in the PRCM module is one type:

- Dynamically configurable by software to scale the domain voltage level to specific values within the operational voltage range of the device. This is called adaptive voltage scaling (AVS).

Figure 3-11 shows a voltage domain.

Figure 3-11. Generic Voltage Domain



Copyright © 2015–2019, Texas Instruments Incorporated

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, a group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. Similarly, when a memory bank is not in use, it can be switched to retention voltage levels to ensure power savings.

3.1.1.3.2 Voltage Domain Management

Figure 3-12 shows the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the logic voltage domains of the device.

Figure 3-12. Generic Logic Voltage Management

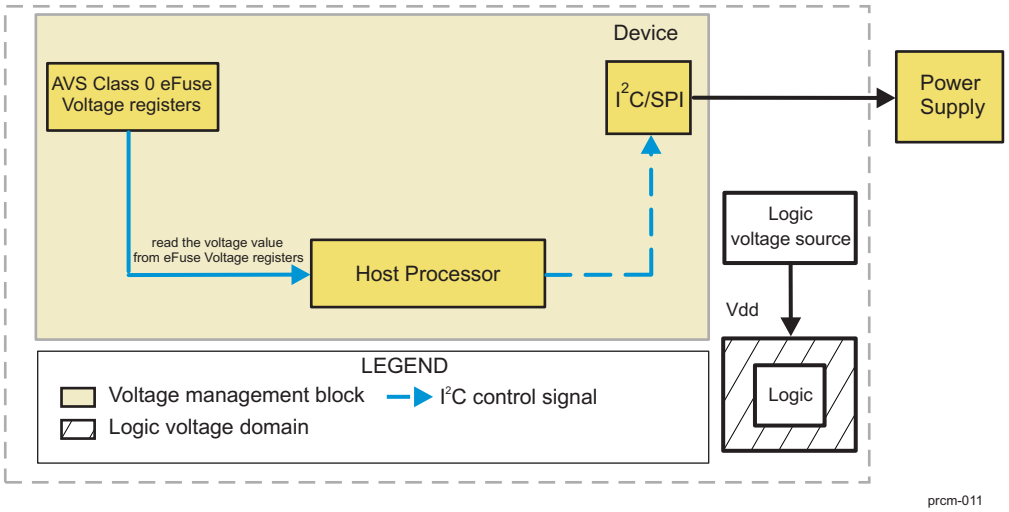


Figure 3-13 shows the voltage control path available within a generic memory voltage management block to control the voltage supply to the memory voltage domains of the device.

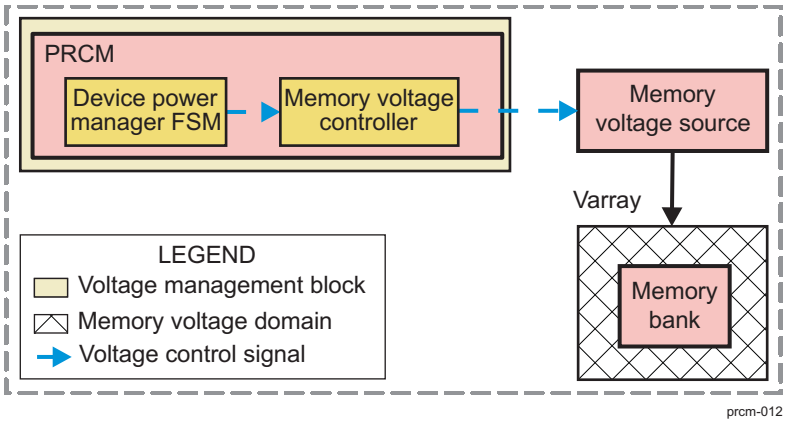
Figure 3-13. Generic Memory Voltage Management



The PRCM hardware supports automatic scaling down of the memory array supply whenever the memory domains transition to RETENTION power state. The device power manager FSM manages the voltage scaling of memory voltage domains through the memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

Adaptive Voltage Scaling (AVS) Class 0 (also referred to as SmartReflex™) is a power-management technique used to control the operating voltage of a device to reduce its active power consumption.

With SmartReflex™, the power supply voltage is adapted to the silicon performance in one way:

Copyright © 2015–2019, Texas Instruments Incorporated

- Statically adapted to the manufacturing process of a given device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum.

The static correction of the device voltage level (see Figure 3-14) is based on the desired performance level and silicon performance characteristics of the device. As a result of process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

Figure 3-14 shows that with the SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

Figure 3-14. SmartReflex Static Voltage Adjustment

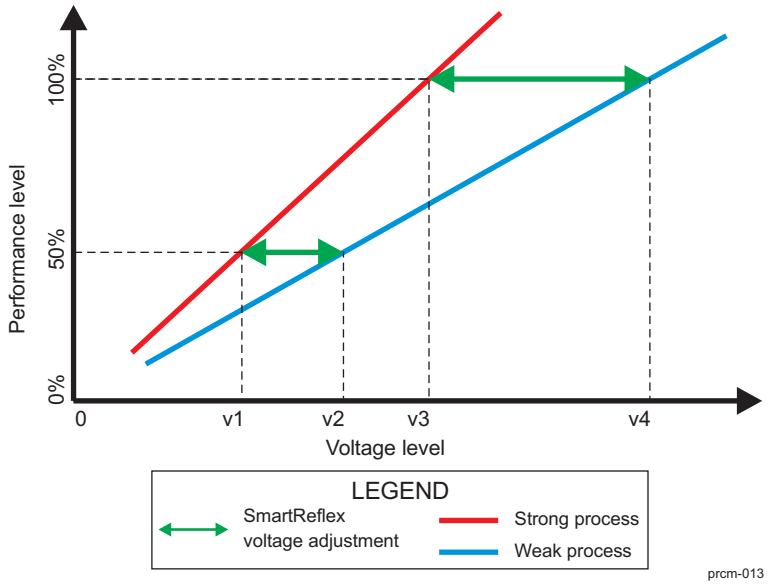


Figure 3-15 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

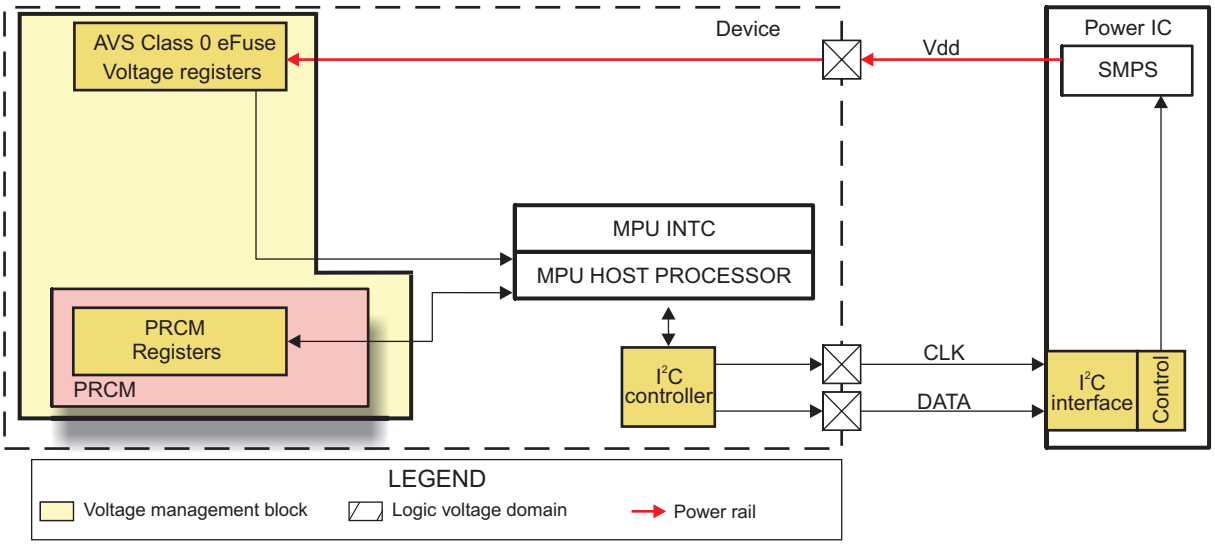
Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-15. SmartReflex Voltage Control Functional Overview



SmartReflex voltage control consists of the following modules:

- MPU HOST Processor
- I^2C interface
- SMPS

The device supports one operational mode for SmartReflex voltage control:

- Class 0: Manufacturing Test Calibration

3.1.1.3.3.1 AVS Class 0 (SmartReflex™) Voltage Control

Adaptive Voltage Scaling (AVS) Class 0 (also referred to as SmartReflex™) is a procedure for lowering the voltage on certain device power rails. AVS Class 0 attempts to normalize the power consumption across all devices. The optimal voltage for each AVS supported rail of each device is determined after analysis in the factory. This value is written in the device eFuse where it can be read through dedicated registers. These registers reside in the control module. For more information, see , *AVS Class 0 Associated Registers*, in Chapter 18, *Control Module*.

3.1.2 Power-Management Techniques

The following sections describe the power-management techniques supported by the device.

NOTE: The values in Figure 3-16 through Figure 3-18, which show the power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

Copyright © 2015–2019, Texas Instruments Incorporated

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in Figure 3-16 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-16. Comparison of Energy Consumed With/Without DVFS

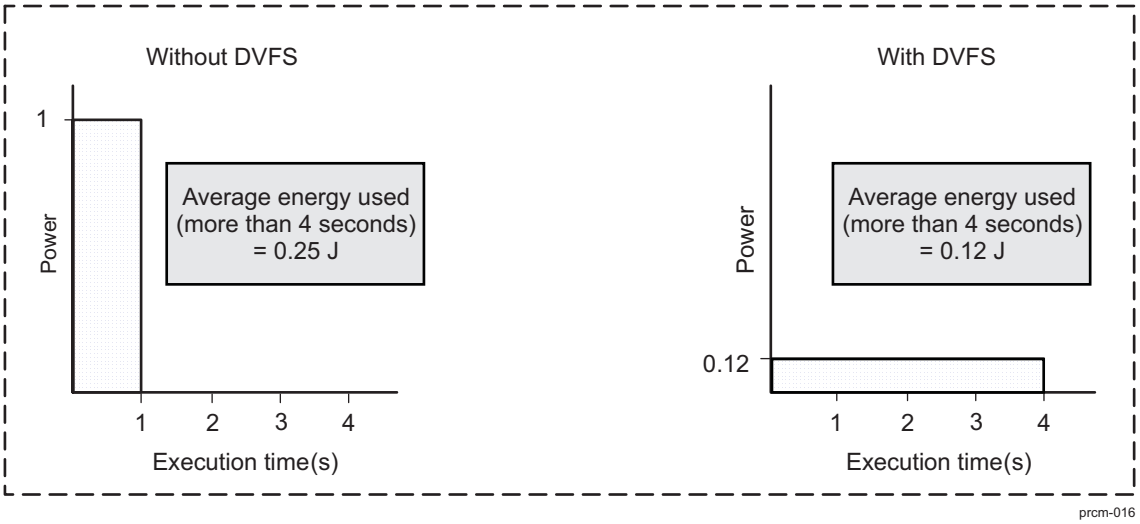


Figure 3-16 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (see the left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode.

With DVFS (see the right side of the figure), the operating frequency is reduced to optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to the development of the device (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique intended to reduce the active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

Copyright © 2015–2019, Texas Instruments Incorporated

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in Figure 3-17 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-17. Comparison of Energy Consumed With/Without DPS

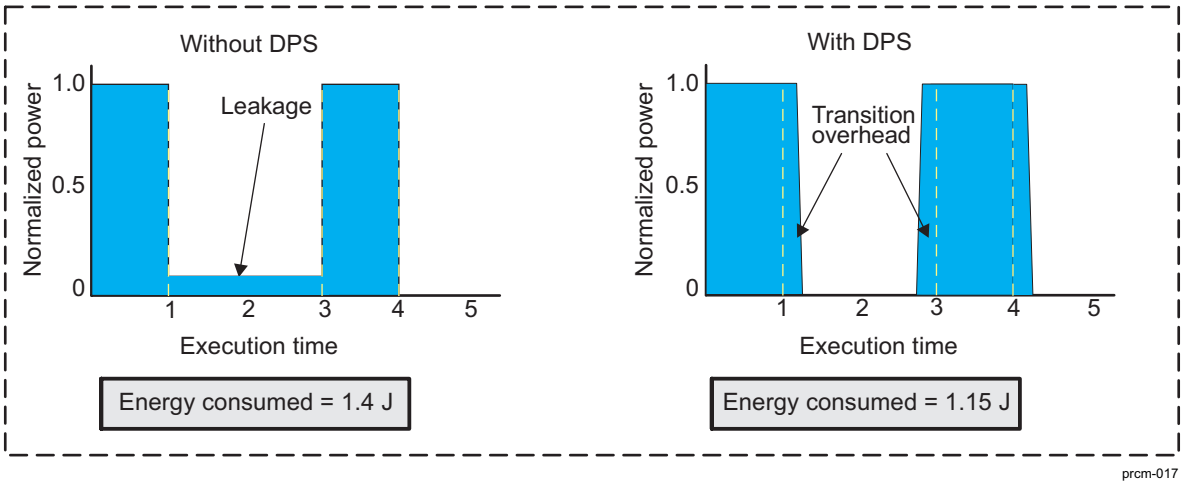

Figure 3-17 compares the behavior of power consumption for the same operation of the device without DPS (see the left side of the figure) and with DPS (see the right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to 0. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-17). This results in additional dynamic power consumption, referred to as transition overhead (see Figure 3-17). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power saving.

3.1.2.4 Adaptive Voltage Scaling

With SmartReflex, power-supply voltage is adapted to silicon performance, statically (based on performance points predefined in the manufacturing process of a given device).

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum. This ensures optimal power consumption for a given OPP.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for forward body bias (FBB) to boost the operating clock frequency for operation at higher OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the EFUSE_CTRL_CUST bit field at the device characterization and is not continuously updated. A dedicated LDO (VBBLDO) is used to produce the voltage bias.

ABB is supported only for MPU, IVAHD, DSPEVE, GPU voltage domains.

Copyright © 2015–2019, Texas Instruments Incorporated

3.1.2.6 SR3-APG (Automatic Power Gating)

In addition to power-management techniques supported in the device, the MPU subsystem also employs SR3-APG power-management technology to reduce leakage. This technology allows for full logic and memory retention on MPU_C0 and MPU_C1 when required conditions are satisfied. It is controlled by the PRCM_MPU. For more information, see Chapter 4, *Cortex-A15 MPU Subsystem*.

3.1.2.7 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS must be used at boot time to adapt the voltage to the process characteristics (strong/weak) of the device. AVS can also ensure the maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation.

SLM must be used when no applications are running and performance requirement drops to 0.

NOTE: The OPPs shown in Figure 3-18 are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

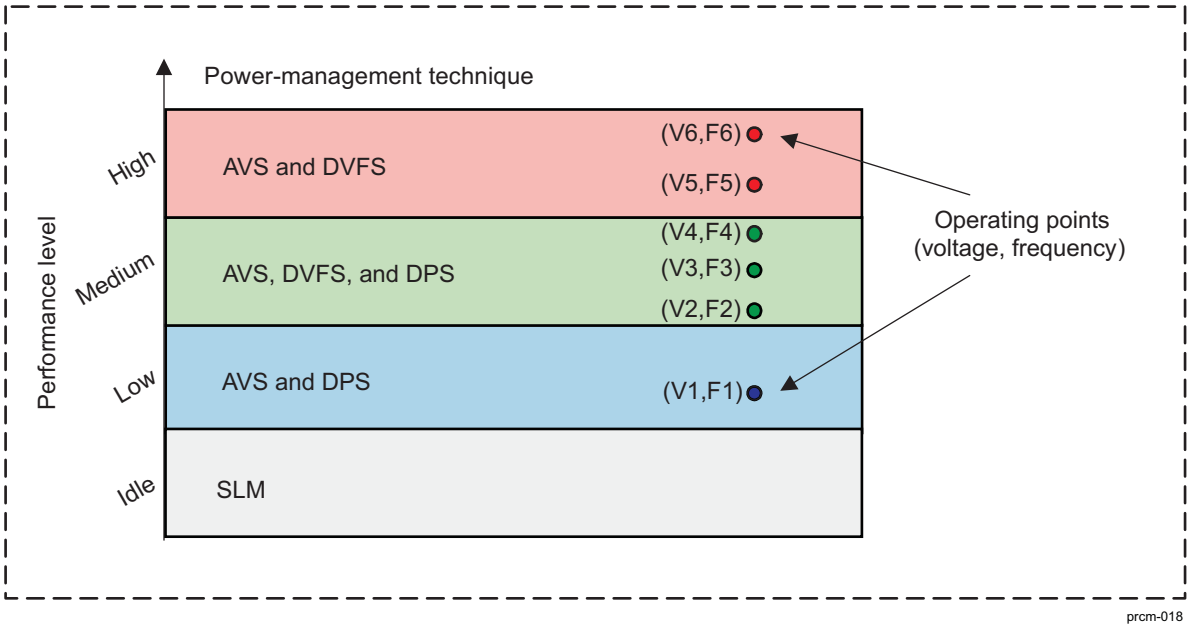
Figure 3-18. Performance Level and Applied Power-Management Techniques



3.1.2.7.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 µs and 100 µs) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1–10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption.

The power-management framework (PMFW) of the device is handled by the PRCM which is a logical module composed of the following three physical submodules:

- PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
- CM_CORE_AON: Handles device-level clock management of the MPU, DSP1, COREAON, CORE, IPU, L4PER, DSS, VPE, L3INIT, CAM, IVAHD, CUSTEFUSE, RTC and GPU power domains. This module always remains on, unless no power is supplied to the device pads.
- CM_CORE: Handles device-level clock management of the MMR block.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of the power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals

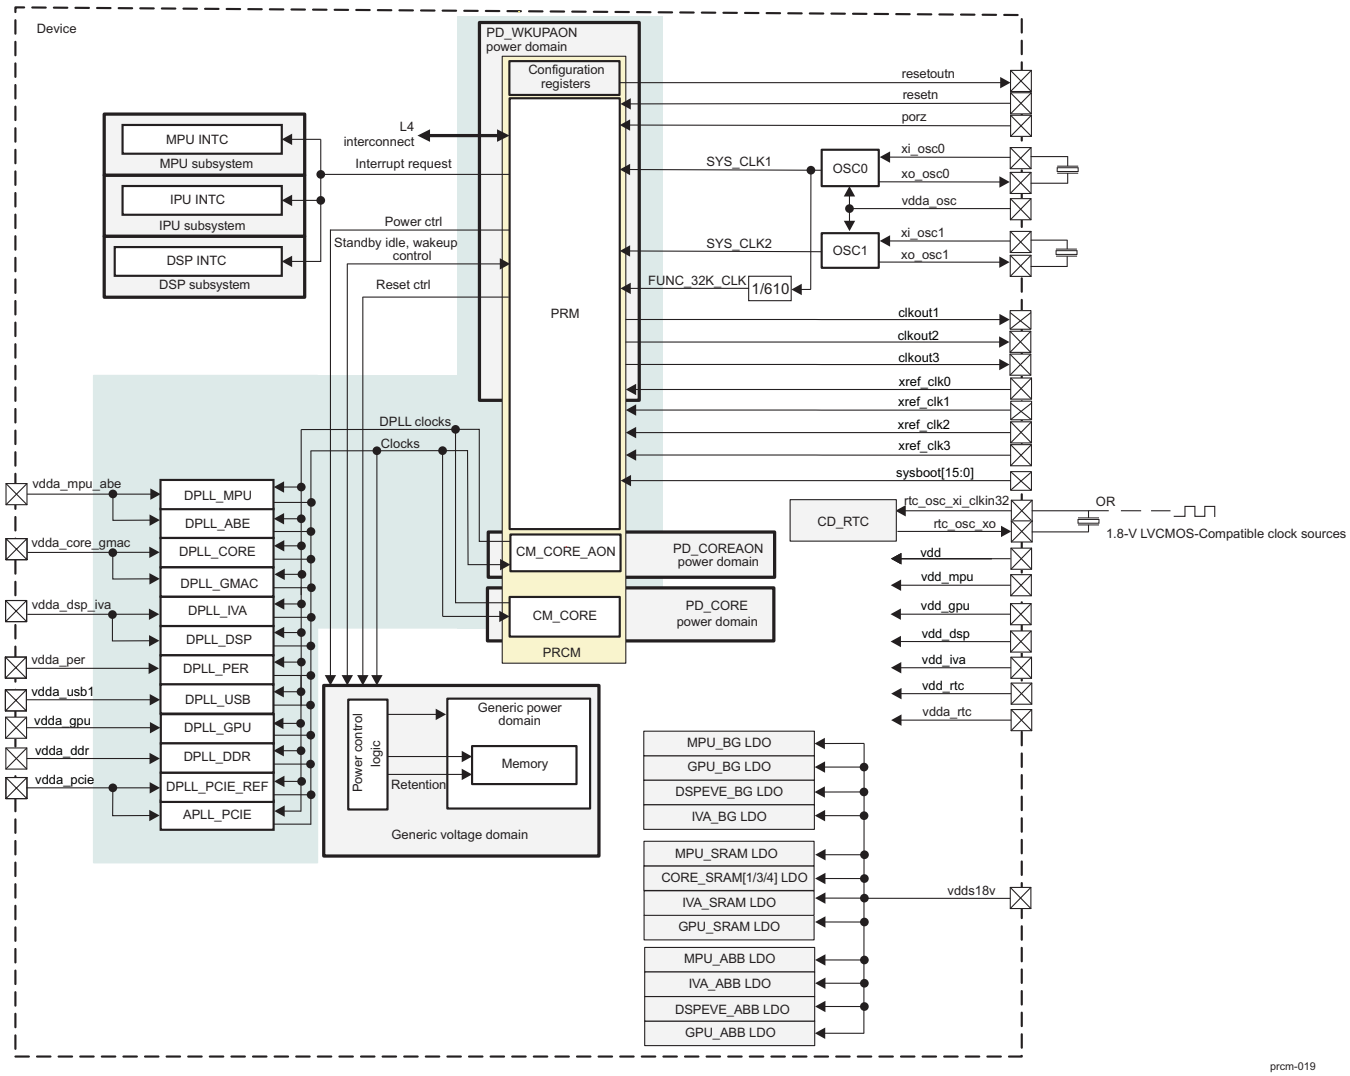
The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their L4 interface ports.

Figure 3-19 is an overview of the power-management modules and their internal connections with a generic power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-19. PMFW Overview



NOTE: The following device pads are not supported on the AM570x family of devices:

- vdd_rtc, vdda_rtc, rtc_osc_xi_clkin32, rtc_osc_xo (RTC is not supported);
- vdd_mpu, vdd_gpu (merged with VD_CORE in package);
- vdd_iva (merged with VD_DSPEVE in package)

For complete list of supported device pads, see device-specific Data Manual.

NOTE: The device I/O logic maps the module signals to the different pads of the device. For more information, see the *Pad Configuration Registers* and sections in Section 18.1, *Control Module*.

3.2.2 Power-Management Framework Features

The power-management modules:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device

Copyright © 2015–2019, Texas Instruments Incorporated

- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Have debug and emulation features
- Control RFFs of device modules to support DPS

Copyright © 2015–2019, Texas Instruments Incorporated

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See Figure 3-19.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

Table 3-23 lists the external clock pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Clock Signals

Pin	Signal	I/O[1]	PMFW Module	Description
rtc_osc_xi_clkin32	RTC_32K_CLK	I	Primary Input to SoC	RTC clock input. Optional external 32k clock.
rtc_osc_xo	32K_CTRL	O	Primary Output	External 32k oscillator clock control (optional).
xi_osc0	XI_OSC0	I	Primary Input to SoC	System Oscillator OSC0 Crystal Input.This is the main system clock of the device.
xo_osc0	XO_OSC0	O	Primary Output	System Oscillator OSC0 Crystal output.
xi_osc1	XI_OSC1	I	Primary Input to SoC	Auxiliary Oscillator OSC1 Crystal input.
xo_osc1	XO_OSC1	O	Primary Output	Auxiliary Oscillator OSC1 Crystal output.
clkout1	CLKOUTMUX1_CLK	O	Primary Output	Device Clock output 1. Can be used as a system clock for other devices.
clkout2	CLKOUTMUX2_CLK	O	Primary Output	Device Clock output 2. Can be used as a system clock for other devices.
clkout3	CLKOUTMUX0_CLK	O	Primary Output	Device Clock output 3. Can be used as a system clock for other devices.
xref_clk0	XREF_CLK0	I	Primary Input to SoC	External Reference Clock 0. For Audio and other Peripherals.
xref_clk1	XREF_CLK1	I	Primary Input to SoC	External Reference Clock 1. For Audio and other Peripherals.
xref_clk2	XREF_CLK2	I	Primary Input to SoC	External Reference Clock 2. For Audio and other Peripherals.
xref_clk3	XREF_CLK3	I	Primary Input to SoC	External Reference Clock 3. For Audio and other Peripherals.

(1) I = Input; O = Output; I/O = Bidirectional

3.3.2 External Boot Signals

The PRM receives SYSBOOT[15:0] information from external pins sys_boot[15:0]. They are used to select interfaces or devices for the booting list. For more information, see Chapter 33, *Initialization*, Section 33.2.4, *Sysboot Configuration* .

Table 3-24 lists the external boot pins, signal names, their direction, the associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-24. External Boot Signals

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot0	SYSBOOT0	I	PRM	System boot configuration pin 0: Latched at power-on reset (POR)	Z
sys_boot1	SYSBOOT1	I	PRM	System boot configuration pin 1: Latched at POR	Z
sys_boot2	SYSBOOT2	I	PRM	System boot configuration pin 2: Latched at POR	Z

(1) I = Input; O = Output; I/O = bidirectional

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-24. External Boot Signals (continued)

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot3	SYSBOOT3	I	PRM	System boot configuration pin 3: Latched at POR	Z
sys_boot4	SYSBOOT4	I	PRM	System boot configuration pin 4: Latched at POR	Z
sys_boot5	SYSBOOT5	I	PRM	System boot configuration pin 5: Latched at POR	Z
sys_boot6	SYSBOOT6	I	PRM	System boot configuration pin6: Latched at POR	Z
sys_boot7	SYSBOOT7	I	PRM	System boot configuration pin 7: Latched at POR	Z
sys_boot8	SYSBOOT8	I	PRM	System boot configuration pin 8: Latched at POR	Z
sys_boot9	SYSBOOT9	I	PRM	System boot configuration pin 9: Latched at POR	Z
sys_boot10	SYSBOOT10	I	PRM	System boot configuration pin 10: Latched at POR	Z
sys_boot11	SYSBOOT11	I	PRM	System boot configuration pin 11: Latched at POR	Z
sys_boot12	SYSBOOT12	I	PRM	System boot configuration pin12: Latched at POR	Z
sys_boot13	SYSBOOT13	I	PRM	System boot configuration pin 13: Latched at POR	Z
sys_boot14	SYSBOOT14	I	PRM	System boot configuration pin 14: Latched at POR	Z
sys_boot15	SYSBOOT15	I	PRM	System boot configuration pin15: Latched at POR	Z

NOTE: For proper device operation, sysboot14 must be tied to vss. For SR1.0, sysboot15 must be tied to vdd, but for SR2.0 it is configurable. For more information, see Section 18.4.6.1.1.1, *Permanent PU/PD disabling (SR2.0 only)* in Chapter 18, *Control Module*.

SR1.0 information is valid only for the AM571x family of devices.

3.3.3 External Reset Signals

The PRM drives the SYS_WARM_OUT_RST reset output signal which is directly mapped as RESETOUT device pin.

The PRM asserts SYS_WARM_OUT_RST output upon the assertion of any source of global reset (warm or cold). SYS_WARM_OUT_RST assertion results in the assertion of device pin RESETOUT. This reset signal keeps external peripherals under reset while the device is under reset.

Table 3-25 lists the external reset pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-25. External Reset Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
resetn	SYS_WARM_IN_RST	I	PRCM	Device Reset Input	Z
rstoutn	SYS_WARM_OUT_RST	O	PRCM	Reset out	Z

(1) I = Input; O = Output; I/O = bidirectional

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-25. External Reset Signals (continued)

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
porz	SYS_PWRON_RST	I	PRCM	Power on Reset	Z

3.3.4 External Voltage Inputs

Table 3-26 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-26 lists only the voltage sources that are directly managed by the PRCM module or received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module. Please refer to the device Data Manual for all power pins.

Table 3-26. Voltage Sources

Pin	Net	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_MPU_L logic voltage domain
vdd_iva	VDD_IVAHD_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_IVAHD_L logic voltage domain
vdd_gpu	VDD_GPU_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_GPU_L logic voltage domain
vdd_dsp	VDD_DSP_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_DSPEVE_L logic voltage domain
vdda_core_gmac	VDDA_DPLL_GMAC	No (fixed)	DPLL_GMAC and HSDIVIDER analog power supply
	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE and HSDIVIDER analog power supply
vdda_mpu_abe	VDDA_DPLL_MPU	No (fixed)	DPLL_MPU analog power supply
	VDDA_DPLL_ABE	No (fixed)	DPLL_ABE analog power supply
vdda_dsp_iva	VDDA_DPLL_IVA	No (fixed)	DPLL_IVA analog power supply
	VDDA_DPLL_DSP	No (fixed)	DPLL_DSP analog power supply
vdda_per	VDDA_DPLL_PER	No (fixed)	DPLL_PER and PER HSDIVIDER analog power supply
vdda_usb1	VDDA_DPLL_USB	No (fixed)	DPLL_USB and HS USB1 analog power supply
vdda_gpu	VDDA_DPLL_GPU	No (fixed)	DPLL_GPU analog power supply
vdda_ddr	VDDA_DPLL_DDR	No (fixed)	DPLL_DDR and DDR HSDIVIDER analog power supply
vdda_pcie	VDDA_DPLL_PCIE	No (fixed)	DPLL_PCIe_REF, APPL_PCIE and PCIe analog power supply
vdd_rtc	VDD_RTC	YES (AVS)	RTC voltage domain supply
vdda_rtc	VDDA_RTC	No (fixed)	RTC bias and RTC LFOSC analog power supply
vdda_osc	VDDA_OSC	No (fixed)	System HF OSC0/1 XTAL oscillators
vdds_18v	VDDA_LDO_BG_MPU	No	Supplies LDO_MPU and BG
	VDDA_LDO_BG_GPU	No	Supplies LDO_GPU and BG
	VDDRAM_MPU1	Yes(AVS)	Supplies LDO_MPU for MPU SRAM
	VDDS_LDO_BG_BBLDO_DSPEVE	No	Supplies LDO_DSPEVE for DSPEVE SRAM

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-26. Voltage Sources (continued)

Pin	Net	Managed by the PRCM	Description
	VDDS_BG_BBLDO_IVA	No	Supplies Bandgap near IVA and BBLDO
	VBBLDO_IVA	Yes(AVS)	IVA Back bias supply
	VBBLDO_MPU	YES(AVS)	MPU Back bias supply
	VBBLDO_DSPEVE	YES(AVS)	EVE-DSP Back bias supply
	VBBLDO_GPU	YES(AVS)	GPU Back bias supply
	VDDRAM_IVA	Yes(AVS)	Supplies LDO_IVA for IVA SRAM
	VDDRAM_CORE1	Yes(AVS)	Supplies LDO_CORE for CORE SRAM
	VDDRAM_CORE3	Yes(AVS)	Supplies LDO_CORE for CORE SRAM
	VDDRAM_CORE4	No	Supplies LDO_CORE for CORE SRAM
	VDDRAM_GPU	Yes(AVS)	Supplies LDO_GPU for GPU SRAM

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective L4_WKUP interconnect. In addition to the L4 interconnect, the internal module interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU, IPU, and DSP INTCs
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-19 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domains, and clock domains. Table 3-27 provides the device-level view with module association to the clock, power, and voltage domains.

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)
- I2C6
- FPKA
- DMA_CRYPTO

These modules are not supported on the AM570x family of devices only:

- SATA
- RTC

(4) VD_MPU and VD_GPU are not supported on the AM570x family of devices (merged with VD_CORE).
(5) VD_IVAHD is not supported on the AM570x family of devices (merged with VD_DSPEVE).
(6) RTC is not supported on the AM570x family of devices.

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-28 lists the PMFW modules and their associated power domains.

Table 3-28. PMFW Module Power Domains

PMFW Module	Power Domain
PRM	PD_WKUPAON
CM_CORE_AON	PD_COREAON
CM_CORE	PD_CORE

The PRM part of the PRCM module is in the PD_WKUPAON power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM_CORE_AON part of the PRCM module is in the PD_COREAON power domain, which is an always-on power domain, while the CM_CORE part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-29).

Table 3-29. PMFW Module Reset Signals

PMFW Module	Reset Signal
PRM	SYS_PWRON_RST_IN
CM_CORE_AON	CM_CORE_AON_PWRON_RST
	CM_CORE_AON_RST
CM_CORE	CM_CORE_PWRON_RET_RST
	CM_CORE_RET_RST

Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: For more information about the reset trigger sources and assertion conditions, see Section 3.5.3, *Reset Sources*.

3.4.2.3 PRCM Interrupt Requests

The PMFW modules can generate the interrupts listed in Table 3-30.

Table 3-30. PMFW Hardware Requests

	Interrupt Requests			
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
PRM	PRM_IRQ_MPU	IRQ_CROSSBAR_6	MPU_IRQ_11 DSP1_IRQ_37	PRM MPU interrupt request
	PRM_IRQ_IPU1	IRQ_CROSSBAR_133	IPU1_IRQ_47 IPU2_IRQ_47	PRM IPU1 interrupt request
	PRM_IRQ_IPU2	IRQ_CROSSBAR_386	-	This IRQ source signal is not mapped by default to eny device INTC.

NOTE: The "**Default Mapping**" column in Table 3-30 *PMFW Hardware Requests* shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

Copyright © 2015–2019, Texas Instruments Incorporated

3.5 Reset Management Functional Description

3.5.1 Overview

In the device, the reset scheme is managed by the PRM, device-level reset manager.

3.5.1.1 PRCM Reset Management Functional Description

The PRM handles the device power-on and warm reset pads: porz, resetn, and rstoutn. The PRM:

- Extends the reset duration beyond the porz pad release
- Provides the reset duration period after the resetn pad assertion
- Routes the device pad resets

The PRM is functionally sensitive to the device POR.

3.5.1.1.1 Power-On Reset

The PRM receives the device POR on the porz reset pad of the device. It extends the duration of the POR module until at least stable 32-kHz clock and SYS_CLK1 are provided to it. The 32-kHz clock and SYS_CLK1 of the device are propagated once the PRCM releases the internal POR.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source or the device PRM module as a result of an internal event.

The PRCM can generate the global reset used by the domain Reset Managers from these warm reset input sources:

- SYS_WARM_IN_RST
- MPU_WDT_RST
- GLOBAL_SW_WARM_RST

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through the <Module name>_SYSCONFIG[x] SOFTRESET configuration register bit). A software reset has the same effect on the module logic as a hardware reset.

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK1 clock. The reset managers in PRM use this clock to stall, or delay, deassertion of reset upon source deactivation.

In each power domain one or more reset domains are defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software-controlled or hardware-triggered reset
- Retention type: Retention reset or nonretention reset

Copyright © 2015–2019, Texas Instruments Incorporated

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset:Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up (POR) or an abnormal operation is detected (watchdog timeout, thermal shutdown, etc.)
- Local reset: Affects one power domain, reset domain, or module.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs on device power up (POR), or in certain emulation modes. Also, it can be software-initiated. Upon cold reset, it is assumed the device is being powered up, and therefore, everything in the device is being reset. That is, cold resets must be considered as global resets.
- Warm reset: Warm reset types are not necessarily applied globally within device. Also, a module can use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM module
- EMIF
- Control module: CTRL_MODULE_CORE, CTRL_MODULE_WKUP

NOTE: The DPLLs state will change after warm reset even though they are not warm reset-sensitive, refer to Section 3.5.6.12, *Global Warm Reset Sequence* for more details.

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in Section 3.12, *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The power domain manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>_DOM_RET_RST and <PowerDomain>_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support CSWRET mechanism. Nonretention type reset source has the following behavior:
  - It is not asserted if the power domain state transitions from the CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are described on the TDA2Ex section.

3.5.3.1 Global Reset Sources

Table 3-31 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the bit triggering the reset is identified.

Table 3-31. Global Reset Sources

Type[1]	Name	Source/Control	Description
H/C	SYS_PWRON_RST	porz input pin	The entire device is held in reset during porz pin assertion. porz pin is typically asserted by external PMIC at POR. PMIC keeps porz asserted until all voltage rails are ramped-up and stable. PRM extends device internal reset after porz release. Refer to Power Supply Sequences in Device Data Manual.
H/W	SYS_WARMIN_RST	resetn input pin	Warm reset from external device. Internal warm reset is triggered by the active (falling) edge of this signal and is extended with RstTime1.
S/C	GLOBAL_COLD_SW_RST	PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	TSHUT_MPU_RST	MPU voltage domain thermal sensor	Asserted when measured temperature is greater than shutdown temperature threshold
H/W	TSHUT_IVA_RST	IVAHD voltage domain thermal sensor	
H/W	TSHUT_CORE_RST	Device thermal sensor, placed close to the ISS, DSP, and IVA	
H/W	TSHUT_DSPEVE_RST	DSPEVE voltage domain thermal sensor	
H/W	TSHUT_GPU_RST	GPU voltage domain thermal sensor	
H/W	ICEPICK_RST	ICEPick™ module	ICEPick warm reset. It is used only in emulation mode.
H/C	ICEPICK_POR_RST	ICEPick module	ICEPick cold reset. It is used only in emulation mode.
H/W	MPU_WDT_RST	WD_TIMER2 or MPU subsystem WDT	It is triggered by a time-out event.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software-controlled or hardware-triggered. Table 3-32 identifies the possible types of hardware-triggered local cold reset sources. Some power domains can support one or both of these local cold reset sources. The table does not list the software-triggered local warm reset sources that are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-32. Local Reset Sources

Type[1]	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain transition from OFF to ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

Copyright © 2015–2019, Texas Instruments Incorporated

3.5.4 Reset Logging

The reset status registers RM_<power domain>_RSTST and PRM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the PRM_RSTST[0] GLOBAL_COLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset is asserted and then released, but a global cold reset source is asserted before the release of the domain reset signal.

3.5.5 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.
- On wakeup from OFF, PWRON_RST is asserted.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset, RET_RST and PWRON_RET_RST are asserted.
- On any global cold reset or wakeup from OFF state to ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.

This section discusses the trigger sources and attributes for all reset domains of the device. For an explanation of each reset trigger source of the device, see Section 3.5.3, *Reset Sources.*

Table 3-33 identifies the associated power and rest domains for each module.

NOTE: The DPLLs state will change after warm reset even though they are not warm reset-sensitive, refer to Section 3.5.6.12, *Global Warm Reset Sequence* for more details.

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)
- FPKA
- DMA_CRYPTO

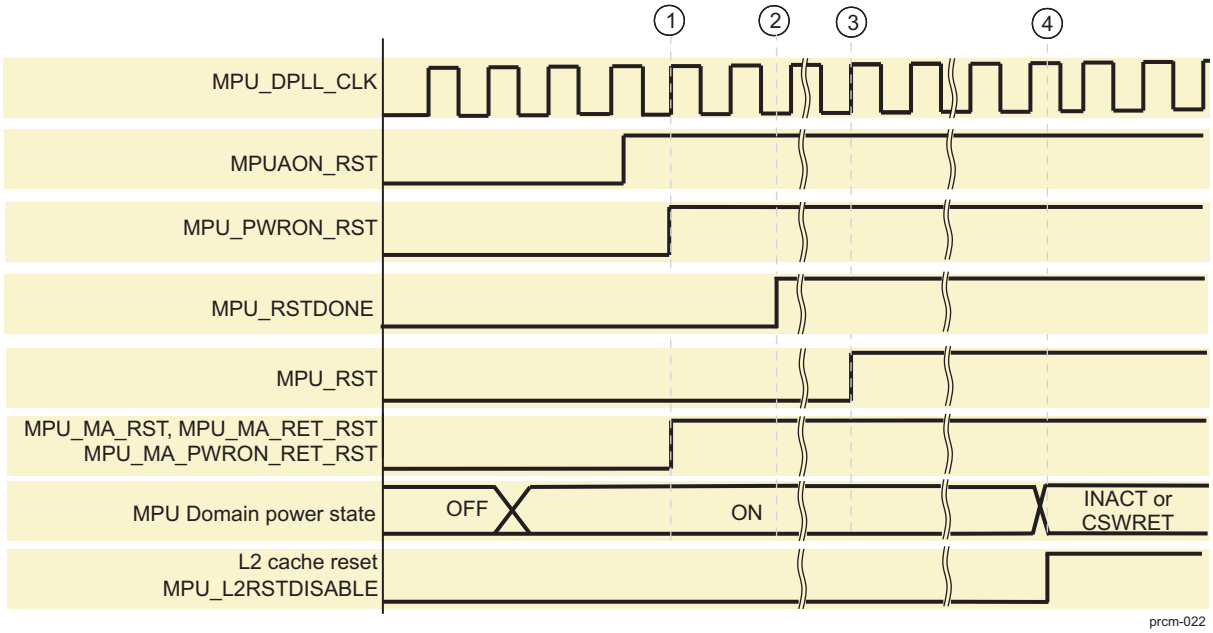
3.5.6 Reset Sequences

3.5.6.1 MPU Subsystem Power-On Reset Sequence

Figure 3-20 shows the POR sequence of the MPU subsystem.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-20. MPU Power-On Reset Sequence



The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules in the MPU subsystem.

The POR sequence is:

1. The PRCM module releases asynchronously in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem.
2. The PRCM module releases in PD_MPU the MPU_PWRON_RST (only after MPU_DPLL_CLK is active) to the MPU subsystem and waits until the subsystem completes its internal reset sequence. MA_MPU (Memory-adapter) dedicated reset signals (MPU_MA_RST, MPU_MA_RET_RST, and MPU_MA_PWRON_RET_RST) are released when MPU_DPLL_CLK is running (at the same time as MPU_PWRON_RST). When PRCM receive active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
3. When the MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the MPU_RST signal and the MPU starts booting.
4. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM module keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

NOTE:

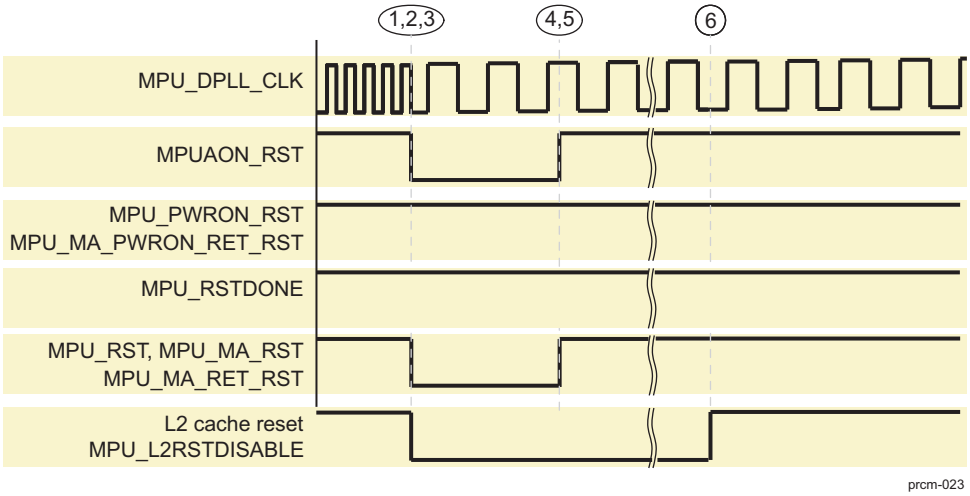
- The reset to the L2 cache memory (MPU_L2RSTDISABLE) in the MPU subsystem is asserted during initial POR (that is, when the PD_MPU wakes up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes up from RETENTION state (that is, when the logic is OFF and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wakeup.
- The L1 cache memory in the MPU subsystem is not retained on PD_MPU wakeup.

3.5.6.2 MPU Subsystem Warm Reset Sequence

Figure 3-21 shows the warm reset sequence of the MPU subsystem.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-21. MPU Warm Reset Sequence



The assumptions are:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.
- A global warm reset to the MPU subsystem is asserted.

The warm reset sequence is:

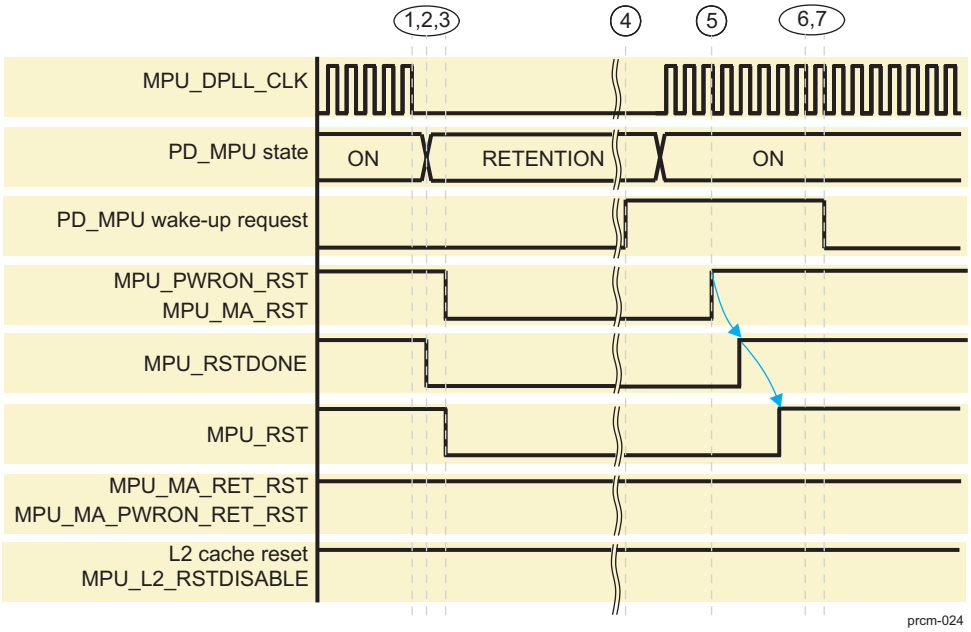
1. The PRCM module asserts in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem. The MPU DPLL is locked.
2. The PRCM module asserts in PD_MPU the MPU_RST reset to the MPU subsystem and also asserts MPU_MA_RST and MPU_MA_RET_RST resets to the MA_MPU module.
3. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
4. The PRCM module releases the MPUAON_RST reset to the INTC_MPU module. The MPU DPLL is in bypass mode.
5. The PRCM module releases MPU_RST, MPU_MA_RST, and MPU_MA_RET_RST only after DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

3.5.6.3 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION State

Figure 3-21 shows the sleep and wake-up transitions reset sequence from the RETENTION state of the MPU subsystem.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-22. MPU Reset Sequence on Sleep and Wake-Up Transition



The assumption is:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.

The sleep and wake-up transitions reset sequence is:

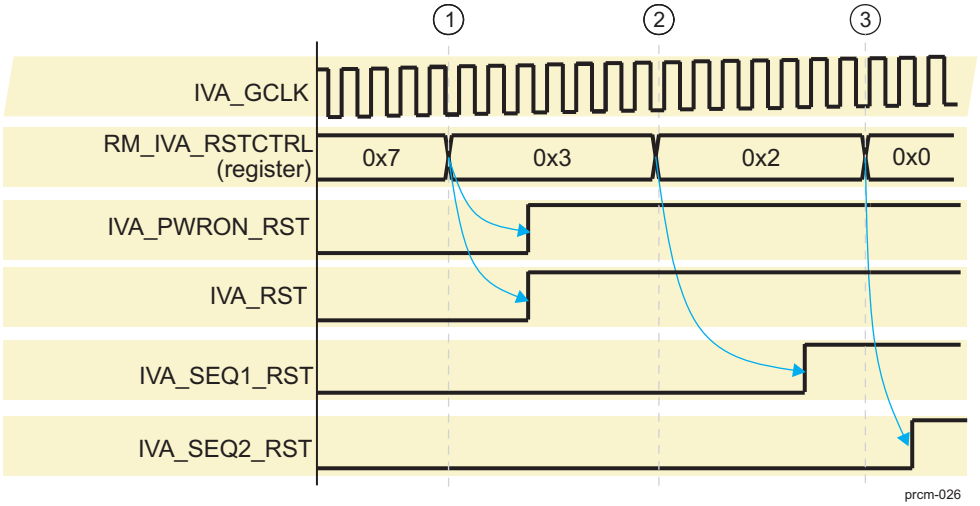
1. The PRCM module gates MPU_DPLL_CLK to the MPU subsystem.
2. The PRCM module switches PD_MPU to RETENTION state.
3. The PRCM module asserts MPU_PWRON_RST and MPU_RST resets to the MPU subsystem, and asserts MPU_MA_RST to the MA_MPU module. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the MPU subsystem is not asserted if the logic in PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
5. The PRCM module releases MPU_RST when the MPU_DPLL_CLK is stable and active. The PRCM deasserts the MPU_PWRON_RST, MPU_MA_RST. When PRCM receives active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
6. During the wakeup from RET state, the MPU_L2RSTDISABLE signal must be maintained at active high so the L2 cache will not be reset when the MPU is reset.

3.5.6.4 IVA Subsystem Power-On Reset Sequence

Figure 3-23 shows the power-on reset sequence of the IVA subsystem.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-23. IVA Power-On Reset Sequence



The power-on reset to IVA is applied when PD_IVA is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the IVA_GCLK functional clock to the IVA subsystem, and it has been enabled by MPU software control.

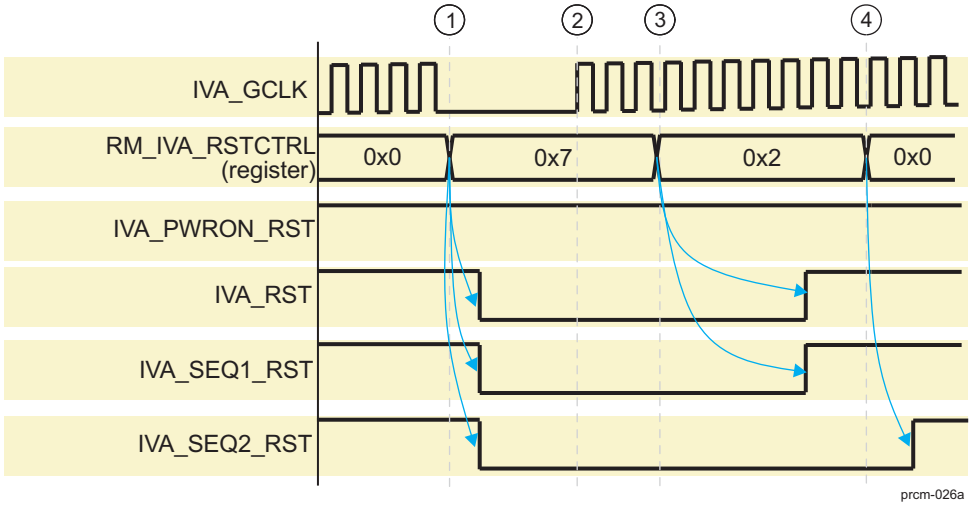
The power-on reset sequence is:

1. Software clears the RM_IVA_RSTCTRL[2] RST_LOGIC bit. This causes the PRCM module to release the IVA_PWRON_RST reset used inside IVA mainly to reset the emulation logic and the IVA_RST reset used to reset all logic inside IVA. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the RM_IVA_RSTCTRL[0] RST_SEQ1 bit. This releases IVA_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.5 IVA Subsystem Software Warm Reset Sequence

Figure 3-24 shows the software warm reset sequence of the IVA subsystem.

Figure 3-24. IVA Software Warm Reset Sequence



Before asserting the software reset to the IVA subsystem the MPU software must ensure that:

Copyright © 2015–2019, Texas Instruments Incorporated

- IVA sequencer CPUs are in IDLE state (CM_IVA_IVA_CLKCTRL[17:16] IDLEST).
- The IVA subsystem is in STANDBY state (CM_IVA_IVA_CLKCTRL[18] STBYST).
- The functional clock to the IVA subsystem has been gated by the PRCM module (CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK).

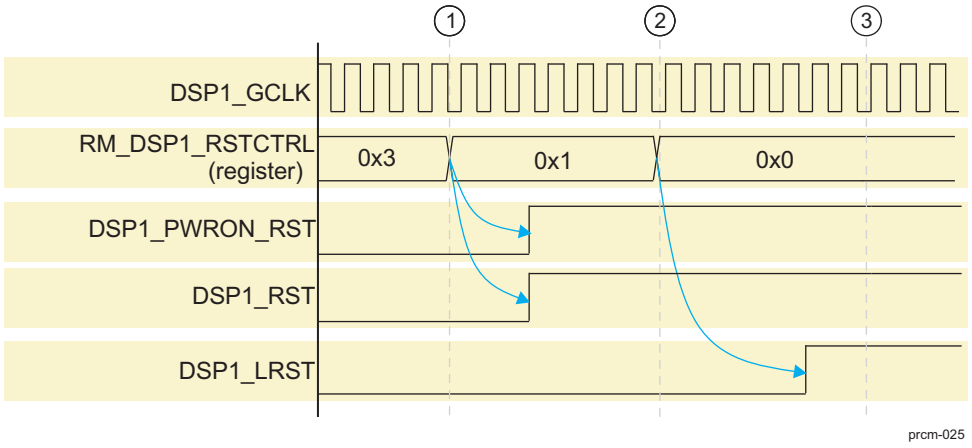
The software reset sequence is:

1. The MPU software sets the RM_IVA_RSTCTRL[2] RST_LOGIC, RM_IVA_RSTCTRL[1] RST_SEQ2, and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to assert the IVA_RST, IVA_SEQ1_RST, and IVA_SEQ2_RST resets to the IVA subsystem. The IVA_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVA subsystem.
3. The MPU software clears the RM_IVA_RSTCTRL[2] RST_LOGIC and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to release the IVA_RST and IVA_SEQ1_RST resets to the IVA subsystem.
4. The MPU software clears the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases the IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.6 DSP1 Subsystem Power-On Reset Sequence

Figure 3-25 shows the power-on reset sequence of the DSP1 subsystem.

Figure 3-25. DSP1 Subsystem Power-On Reset Sequence



The power-on reset to DSP1 is applied when PD_DSP1 is powered. The assumptions ofter power-on reset assertion are:

- PD_DSP1 is on.
- The PRCM module provides DSP1_GCLK functional clock to the DSP subsystem, and it has been enabled by MPU software control.

The Power-On Reset sequence is:

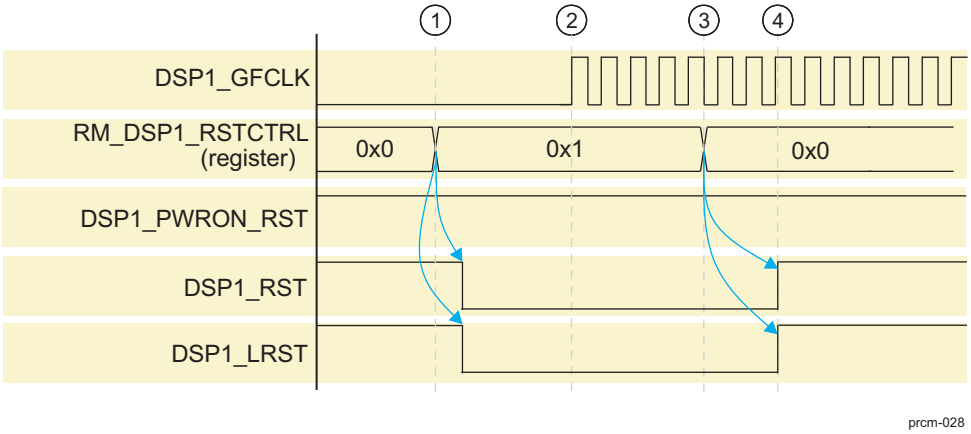
1. Software clears the RM_DSP1_RSTCTRL[1] RST_DSP1 bit. This causes the PRCM module to release the DSP1_PWRON_RST used inside DSP1 mainly to reset the emulation logic and the DSP1_RST used to reset all logic inside DSP1. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the memory is initialized, software clears the RM_DSP1_RSTCTRL[0] RST_DSP1_LRST bit. This release DSP1_LRST to the local CPU inside DSP subsystem.

3.5.6.7 DSP1 Subsystem Software Warm Reset Sequence

Figure 3-26 shows the software warm reset sequence of the DSP1 subsystem.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-26. DSP1 Subsystem Software Warm Reset Sequence



Before asserting the software reset to the DSP subsystem, the MPU software must ensure that:

- The DSP CPUs are in IDLE state (CM_DSP1_DSP1_CLKCTRL[17:16] IDLEST).
- The DSP subsystem is in STANDBY state (CM_DSP1_DSP1_CLKCTRL[18] STBYST).
- The functional clock to the DSP subsystem has been gated by the PRCM module (CM_DSP1_CLKSTCTRL[8] CLKACTIVITY_DSP1_GFCLK)

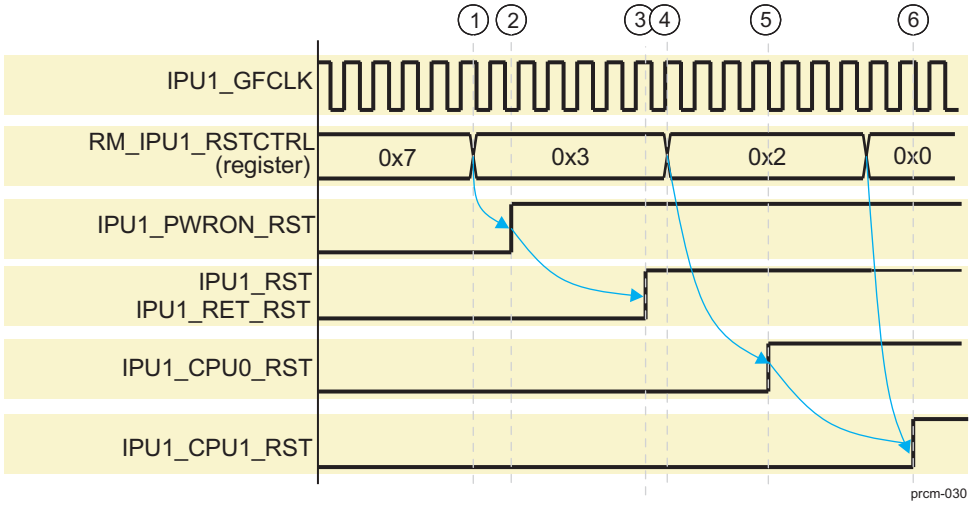
The software reset sequence is:

1. MPU software sets the RM_DSP1_RSTCTRL[1] RST_DSP1 = 0 and RM_DSP1_RSTCTRL[0] RST_DSP1_LRST = 1. This causes the PRCM module to assert DSP1_RST, DSP1_LRST to the DSP subsystem. The DSP1_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the DSP subsystem.
3. The MPU software cleares theRM_DSP1_RSTCTRL[1] RST_DSP1 and RM_DSP1_RSTCTRL[0] RST_DSP1_LRST bits. This causes the PRCM module to release DSP1_RST and DSP1_LRST to the DSP subsystem.

3.5.6.8 IPU1 Subsystem Power-On Reset Sequence

Figure 3-27 shows the power-on reset sequence of the IPU1 subsystem.

Figure 3-27. IPU1 Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:

Copyright © 2015–2019, Texas Instruments Incorporated

- IPU1_PWRON_RST
- IPU1_RET_RST
- IPU1_CPU0_RST
- IPU1_CPU1_RST
- IPU1_RST

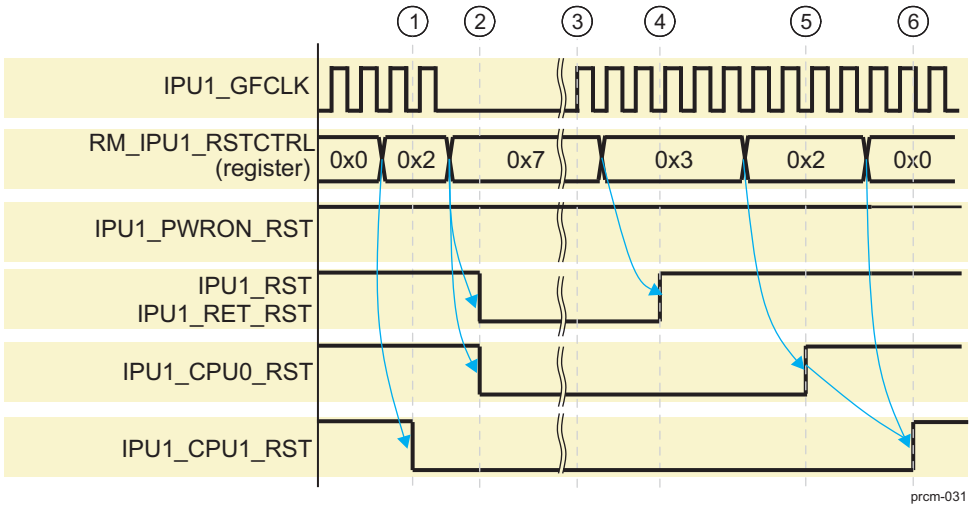
The power-on reset sequence is:

1. Software clears the RM_IPU1_RSTCTRL[2] RST_IPU bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU1_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU1_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU1_RST and IPU1_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU1_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU1_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU_CPU1_RST to IPU_C1.

3.5.6.9 IPU1 Subsystem Software Warm Reset Sequence

Figure 3-28 shows the software warm reset sequence of the IPU1 subsystem.

Figure 3-28. IPU1 Subsystem Software Warm Reset Sequence



For doing the software reset of IPU1, the MPU software must ensure that IPU CPUs (IPU1_C0 and IPU1_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

1. When IPU1_C1 is in IDLE state, IPU1_C0 software or MPU software sets the RM_IPU1_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU1_CPU1_RST reset signal to IPU1_C1.
2. When IPU1_C0 is in IDLE state, the MPU software sets the RM_IPU1_RSTCTRL[2] RST_IPU and RM_IPU1_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU1_RST, IPU1_RET_RST, and IPU1_CPU0_RST reset signals. The IPU1_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU1_GFCLK and the initialization sequence starts inside the IPU

Copyright © 2015–2019, Texas Instruments Incorporated

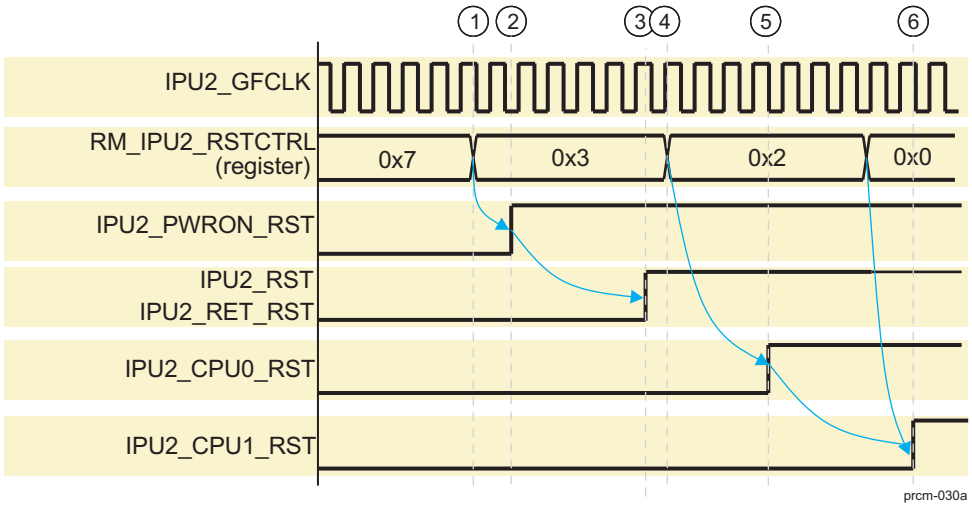
subsystem. Software clears the RM_IPU1_RSTCTRL[2] RST_IPU bit and RM_IPU1_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.

5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU1_RST, IPU1_RET_RST, and IPU1_CPU0_RST reset signals. IPU1_C0 starts rebooting.
6. Software can then clear the RM_IPU1_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU1_CPU1_RST reset signal to IPU1_C1 to start booting.

3.5.6.10 IPU2 Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the IPU2 subsystem.

Figure 3-29. IPU2 Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU2_PWRON_RST
  - IPU2_RET_RST
  - IPU2_CPU0_RST
  - IPU2_CPU1_RST
  - IPU2_RST

The power-on reset sequence is:

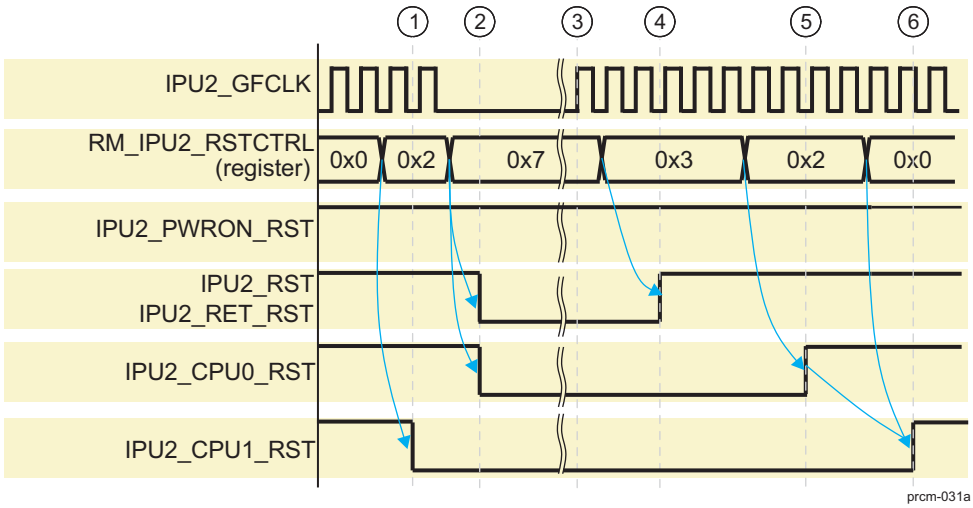
1. Software clears the RM_IPU2_RSTCTRL[2] RST_IPU bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU2_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU2_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST and IPU2_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU2_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU2_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU2_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU2_CPU1_RST to IPU_C1.

Copyright © 2015–2019, Texas Instruments Incorporated

3.5.6.11 IPU2 Subsystem Software Warm Reset Sequence

Figure 3-30 shows the software warm reset sequence of the IPU2 subsystem.

Figure 3-30. IPU2 Subsystem Software Warm Reset Sequence



For doing the software reset of IPU2, the MPU software must ensure that IPU CPUs (IPU2_C0 and IPU2_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

1. When IPU2_C1 is in IDLE state, IPU2_C0 software or MPU software sets the RM_IPU2_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU2_CPU1_RST reset signal to IPU2_C1.
2. When IPU2_C0 is in IDLE state, the MPU software sets the RM_IPU2_RSTCTRL[2] RST_IPU and RM_IPU2_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU2_RST, IPU2_RET_RST, and IPU2_CPU0_RST reset signals. The IPU2_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU2_GFCLK and the initialization sequence starts inside the IPU subsystem. Software clears the RM_IPU2_RSTCTRL[2] RST_IPU bit and RM_IPU2_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU2_RST, IPU2_RET_RST, and IPU2_CPU0_RST reset signals. IPU2_C0 starts rebooting.
6. Software can then clear the RM_IPU2_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU2_CPU1_RST reset signal to IPU2_C1 to start booting.

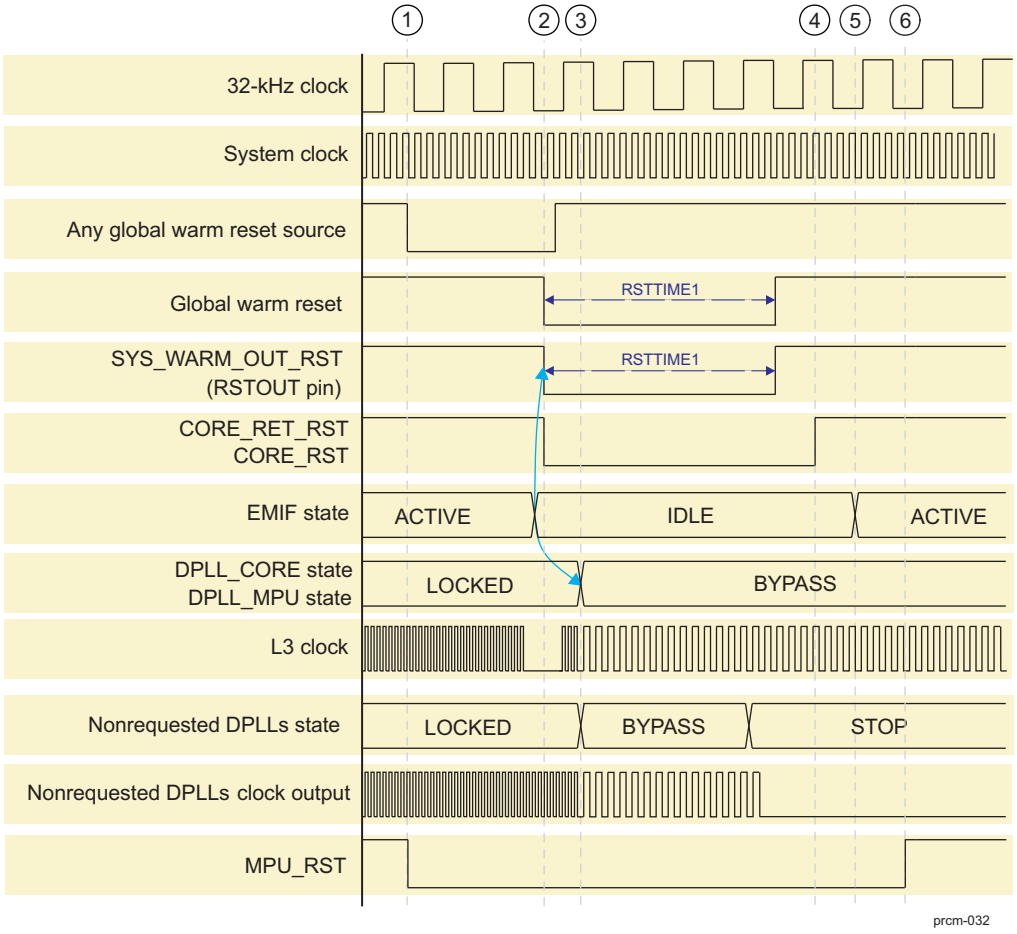
3.5.6.12 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-31 shows the global warm reset sequence.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-31. Global Warm Reset Sequence



The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and IVA DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates the transition to IDLE state. The PRCM module delays global warm reset to the device for a minimum of 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM to self-refresh mode.
2. The reset managers in the PRM assert the following resets:
   - The external warm reset SYS_WARM_RST (rstoutn pin).
   - All power domain warm resets are asserted.
   - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
   - DPLL hardware resets are not asserted.
     - DPLL_MPU transitions to bypass mode.
     - DPLL_CORE transitions to bypass mode once the EMIF switches to IDLE state.
     - DPLL_IVA, DPLL_PER, DPLL_USB, DPLL_DSP, DPLL_GPU and DPLL_DDR transition to idle bypass low-power mode. Then as clock signals are no more requested, they are gated and these DPLLs goes to stop mode.

Copyright © 2015–2019, Texas Instruments Incorporated

  - DPLL_ABE configuration is not changed.
  - DPLL_GMAC configuration is not changed.
- CM gates the clocks that are not needed, as per their default reset setting in the associated registers.

3. The device warm reset (internal and rstoutn pin) duration is set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field. It defines the global warm reset duration in number of FUNC_32K_CLK clock cycles. Default value loaded after POR is 6 clock cycles. During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
4. The CORE power domain is released from reset (that is, warm reset-sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF from IDLE state back to ACTIVE state.
6. PD_MPU is released from reset when the clocks to the MPU subsystem are active. The MPU reboots.

NOTE:

- The PD_DSP and PD_IVA, PD_IPU2 power domains are held under reset after global warm reset by assertion of the software source of the reset.
- The following are held under reset after global warm reset until the PRCM module enables their interface clock:
  - PD_L4PER
  - PD_L3INIT
  - PD_DSS
  - PD_GPU
  - PD_CAM

3.6 Clock Management Functional Description

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)
- I2C6

These modules are not supported on the AM570x family of devices only:

- SATA
- RTC

3.6.1 Overview

The PRCM module provides the control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. For information about the clock-management functional architecture of the device, see Section 3.1.1.1, *Clock Management*.

The PRCM module provides clocks to the internal DPLLs for internal high-frequency clock generation. Clock division and gating are handled by the PRM, CM_CORE_AON, and CM_CORE sections of the PRCM module. Figure 3-32 shows the high-level clock-management scheme in the device.

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.2 External Clock Inputs

3.6.2.1 FUNC_32K_CLK Clock

The 32-kHz frequency is used for low-frequency operation. FUNC_32K_CLK is derived from SYS_CLK1. It supplies the always-on wake-up domain for operation in lowest power mode and as the clock source to the DPLL_ABE.

3.6.2.2 High-Frequency System Clock Input

The system clocks SYS_CLK1 and SYS_CLK2, are the main source clocks of the device. SYS_CLK1 and SYS_CLK2 are received directly from internal oscillators (OSC0 and OSC1) of the PRCM module. They are supplied as the reference clock to the DPLLs and as functional clock to several modules.

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.2.3 External Reference Clock Input

The external reference clocks xref_clk0, xref_clk1, xref_clk2 and xref_clk3 are received directly from external reference clock source for the device. They are supplied as the functional clock to the TIMERs and as reference clock to the McASP and other peripherals.

3.6.3 Internal Clock Sources and Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives system clocks SYS_CLK1 and SYS_CLK2 inputs.
- CM_CORE_AON and CM_CORE clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

Table 3-36. Internal Clock Sources

Clock Name	Source	Frequency	Note
FUNC_32K_CLK	SYS_CLK1/610	32 KHz	see Section 3.6.3.1 *PRM Clock Source*
SYS_CLK1	xi_osc0	19.2, 20, 27 MHz	see Section 3.6.3.1 *PRM Clock Source*
SYS_CLK2	xi_osc1	(19.2 - 32) MHz	see Section 3.6.3.1 *PRM Clock Source*
OSC_32K_CLK(1)	On-die 32K RC Osc	32 KHz	see Section 3.6.3.2.2CM_CORE_AON_CLKOUTMUX Overview
FUNC_96M_AON_CLK	DPLL_PER	96 MHz	see Section 3.6.3.4 *DPLL_PER Description*
FUNC_192M_CLK	DPLL_PER	192 MHz	see Section 3.6.3.4 *DPLL_PER Description*
FUNC_128M_CLK	DPLL_PER	128 MHz	see Section 3.6.3.4 *DPLL_PER Description*
CORE_CLK	DPLL_CORE	532 MHz	see Figure 3-10 *DPLL_CORE Description*

(1) The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.3.1 PRM Clock Source

NOTE: The audio back end (ABE) module is not supported for this family of devices, but the ABE name is still present in some clock or DPLL names.

The PRM clock source receives the SYS_CLK1 and SYS_CLK2 clocks from external input pins. Along with these clocks, it receives a clock ABE_LP_CLK, divided version of DPLL_ABE_X2_CLK, which is generated by DPLL_ABE. The PRM manages the low-frequency clocks associated with these four (counting also FUNC_32K_CLK as an input clock) input clocks. The PRM sources various versions (through gating controls) of these externally sourced clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- The various timers and watchdog timers with clocks supplied by always-on buffers
- The clocks for the CM clock generator and the CORE power domain
- Timer functional clocks
- The bandgap and control module for thermal sensor feature
- Reference clock for various modules:
  - USB_OTG_SS
  - SATA

Figure 3-33 is a logical representation of the PRM clock source.

Table 3-37. PRM Clock Division and Muxing Control (continued)

Divider/Mux	Control Bit Field
Divider L3INSTR_TS_GCLK and L3INSTR_DLL_AGING_GCLK	CM_L3INSTR_CTRL_MODULE_BANDGAP_CLKCTRL[25:24] CLKSEL

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

The PRM provides a 32-kHz gated and ungated clock for use by portions of the PD_WKUPAON power domain and some peripherals outside the PD_WKUPAON power domain.

The PRM creates COREAON_32K_GFCLK (gated version of FUNC_32K_CLK) to provide 32kHz clock to peripherals outside of PD_WKUPAON.

It also provides the system clock to the DSS, a gated and buffered version to the WKUPAON_GICLK interconnect clock, and the DPLLs controlled by the PRCM module.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities: CM_CORE_AON, which is placed in the PD_COREAON always-on power domain, and CM_CORE, which is placed in the PD_CORE switchable power domain. The split is done to provide control over various entities, such as modules, DPLLs, and clocks, during low-power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM_CORE_AON Clock Generator

CM_CORE_AON receives a system clocks (SYS_CLK1 and SYS_CLK2) from the PRM, which serves as its functional clock. CM_CORE_AON provides a gated clock to

- PD_CAM
- PD_CORE
- PD_CUSTEFUSE
- PD_DSP1
- PD_DSS
- PD_EMU
- PD_GPU
- PD_IPU
- PD_IVA
- PD_L3INIT
- PD_L4PER
- PD_MPU
- PD_RTC
- PD_VPE
- PD_WKUPAON
- PD_COREAON
- PD_MMAON
- PD_MPUAON

and some DPLLs:

- DPLL_MPU
- DPLL_IVA
- DPLL_GPU

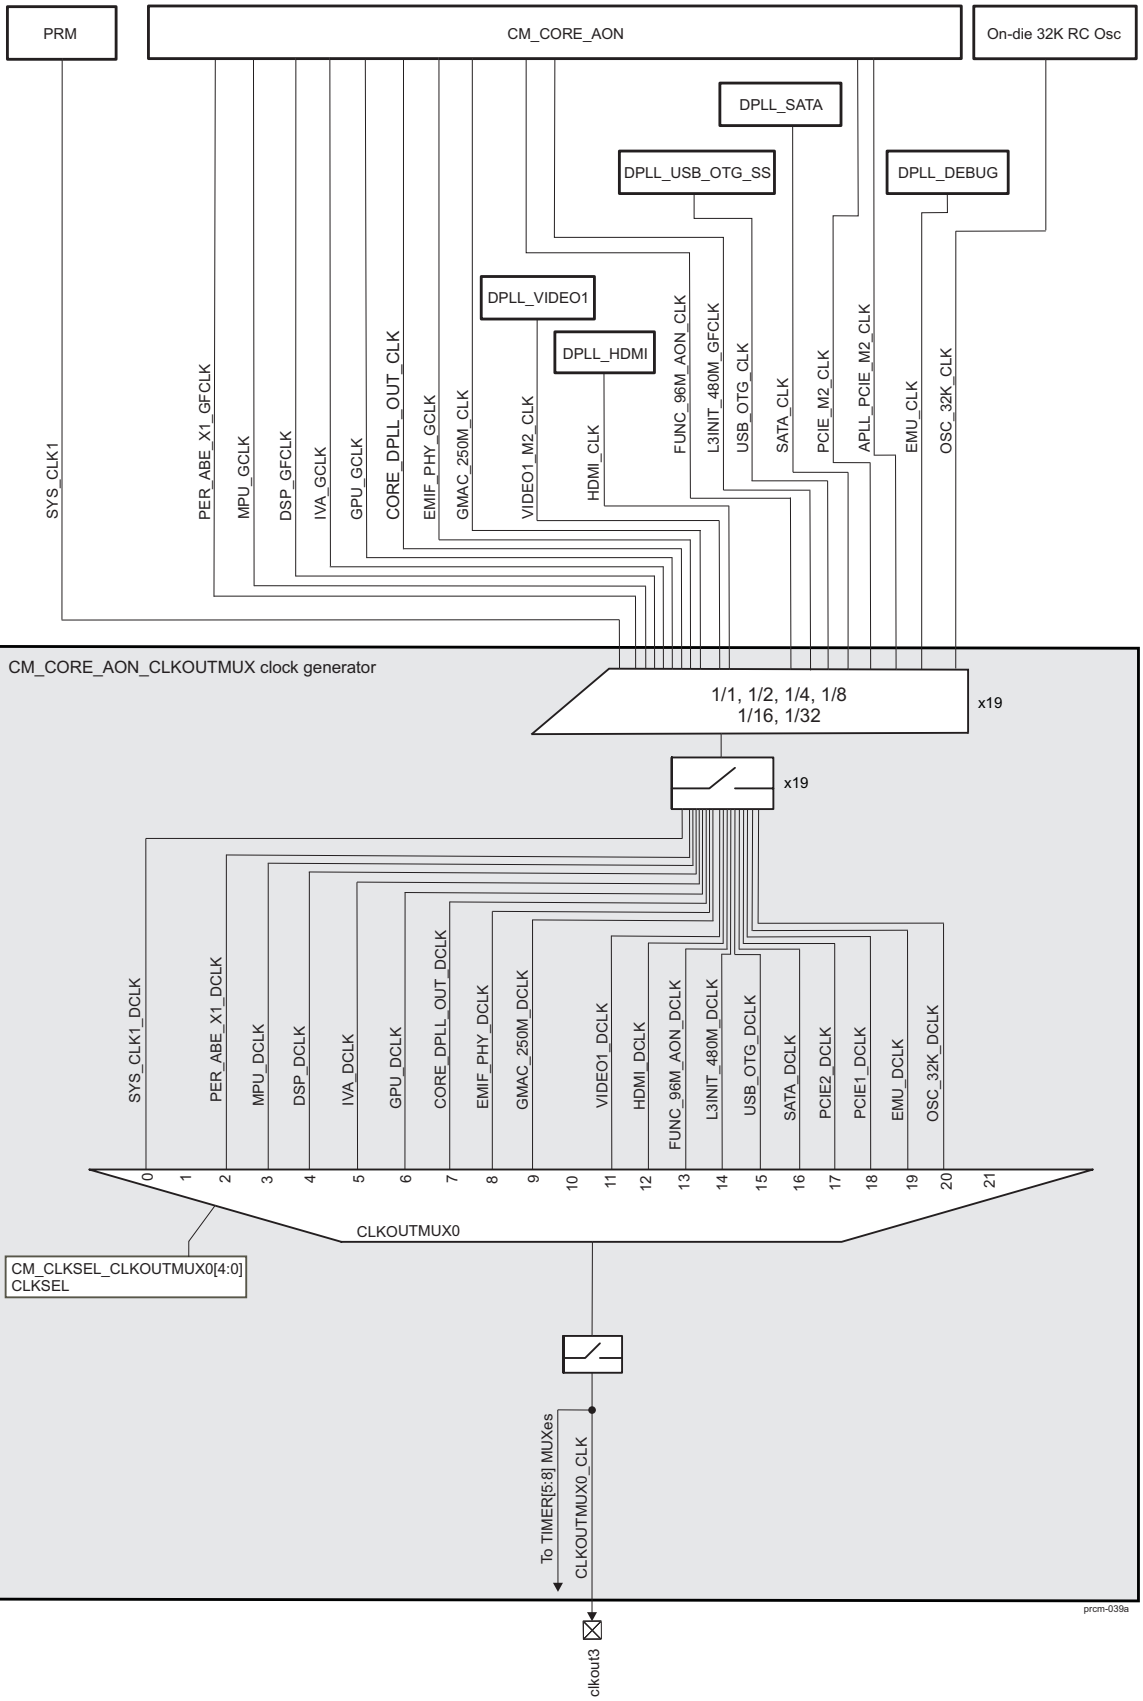
3.6.3.2.2 CM_CORE_AON_CLKOUTMUX Overview

Figure 3-36 is an overview of the CM_CORE_AON_CLKOUTMUX.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-36. CM_CORE_AON_CLKOUTMUX Clock Manager Overview (CLKOUTMUX0)



Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: There is no dedicated register to enable CLKOUTMUX0_CLK clock to propagate to clkout3 device pad. CLKOUTMUX0_CLK will stay gated until one of the TIMER5/6/7/8 is enabled and CLKOUTMUX0 _CLK is selected as the source clock for the timer functional clock.

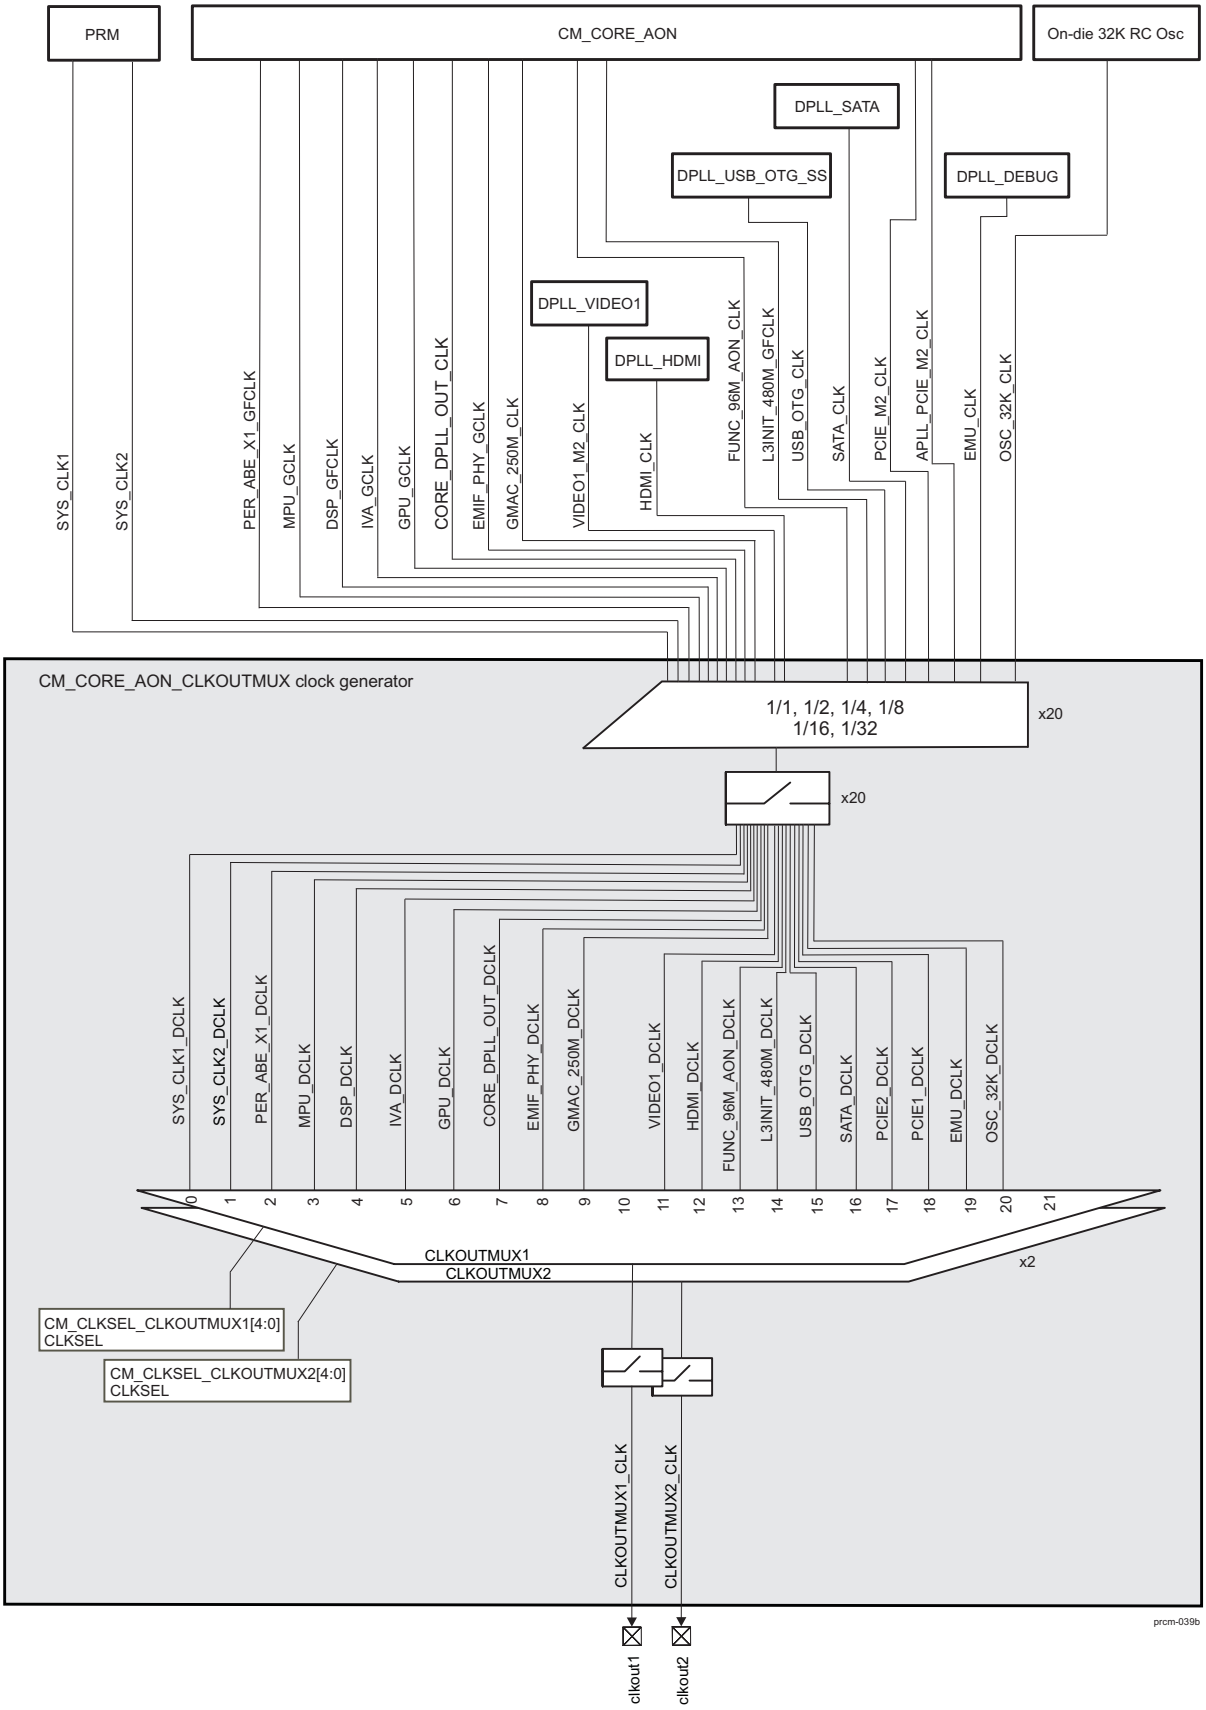
The CLKOUTMUX0_CLK clock is propagated to clkout3 device pad only when at least one of the following registers is configured: CM_IPU_TIMER5/6/7/8_CLKCTRL[27:24] CLKSEL (value: 0xB).

In addition, if the user wants to propagate MPU_GCLK to device pad (clkout3), he also needs to ungate the clock from the hardware observability control register: CTRL_CORE_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE (value: 0x1).

NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-37. CM_CORE_AON_CLKOUTMUX Clock Manager Overview (CLKOUTMUX1 and CLKOUTMUX2)



Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: In order to enable CLKOUTMUX1_CLK and CLKOUTMUX2_CLK clocks to propagate to the corresponding device pads (clkout1 and clkout2), the user needs to configure registers: CM_COREAON_CLKOUTMUX1_CLKCTRL[8] OPTFCLKEN_CLKOUTMUX1_CLK (value: 0x1) and CM_COREAON_CLKOUTMUX2_CLKCTRL[8] OPTFCLKEN_CLKOUTMUX2_CLK (value: 0x1).

In addition, if the user wants to propagate MPU_GCLK to device pad (clkout1 or clkout2), he also needs to ungate the clock from the hardware observability control register: CTRL_CORE_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE (value: 0x1).

NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

The following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE
- DPLL_DSP
- DPLL_GMAC
- DPLL_GPU
- DPLL_DDR

The following DPLLs belong to type B:

- DPLL_USB
- DPLL_PCIE_REF

All DPLLs (type A and type B) support the features described in the following sections, unless otherwise identified.

Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are described in their respective subsystems.

3.6.3.3.1 Generic APLL Overview

APLL_PCIE is an analog PLL which supplies high speed clock to PCI Express. APLL_PCIE is controlled directly by the PRCM module.

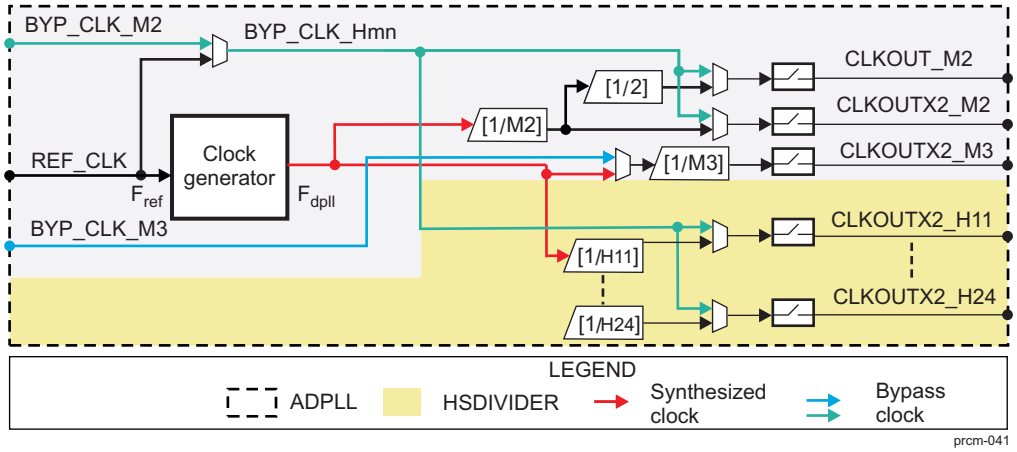
All the feature support by APLL_PCIE are described in Section 3.6.3.15, *APLL_PCIE Description*

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.3.3.2 DPLLs Output Clocks Parameters

Figure 3-45 shows the functional architecture of a generic DPLL.

Figure 3-45. Generic DPLL Functional Diagram



The DPLL has three input clocks:

- REF_CLK: Used to generate the synthesized clock but can also be used as the bypass clock for some outputs of the DPLL whenever the DPLL enters bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional)
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional)

The DPLL provides the bypass clock used by HSDIVIDER: BYP_CLK_Hmn, which is output by the multiplexer between the BYP_CLK_M2 and REF_CLK clock signals.

NOTE: The [1/2] divider located after the M2 post-divider is not valid when the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when a frequency higher than 1.4 GHz is needed).

The DPLL can be programmed to be locked at any frequency given by one of the following equations:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case the CM_CLKMODE_DPLL_ABE[11] DPLL_REGM4XEN bit is set (applies only to DPLL_ABE)
- $F_{dpll} = F_{ref} \times (M / (N + 1))$ in case the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when frequency higher than 1.4GHz is needed).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency. F_{ref} is also known as CLKINP.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

NOTE: It is preferred to minimize the value for N parameter (it minimizes lock time and jitter). Then M should be chosen to provide correct frequency (with lowest delta as possible).

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as shown in Table 3-43.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-43. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

Output	Equation	DPLL Mode
CLKOUT_M2	F_{dpll} / (2 x M2)	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set) with M2 set to 0x1.
CLKOUTX2_M2	F_{dpll} / M2	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M3	F_{dpll} / M3 or BYP_CLK_M3/M3	Locked (typical case)
	0	Before lock or during relock
	F_{dpll} / M3 or BYP_CLK_M3/M3	DC corrector logic is used (DCC_EN bit is set).

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state by using the M2 bypass clock select control bit.
- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state by using the M3 clock select control bit.

NOTE:

- A value of 0 for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT_M2 is generated based on a fixed divide-by-2 ratio, except in bypass mode.

The DPLL can contain one or two HSDIVIDER modules to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER1 provides four extra post-dividers from H11 to H14 (the output clocks are CLKOUTX2_H11 through CLKOUTX2_H14). HSDIVIDER2 provides four extra post-dividers from H21 through H24 (the output clocks are CLKOUTX2_H21 through CLKOUTX2_H24). The HSDIVIDER output clock frequency is given by the equations in Table 3-44.

Table 3-44. CLKOUTX2_Hmn Frequencies With DPLL State

Equation	DPLL Mode
CLKOUTX2_Hmn = F_{dpll} /Hmn	Locked
CLKOUTX2_Hmn = BYP_CLK_Hmn	Before lock or during relock

Where:

- F_{dpll} is the DPLL lock frequency.
- Hmn is the software-configured division ratio binary value.
- n is in the range from 1 to 4.
- m is equal to 1 or 2.

NOTE: Hmn division ratio is set to 1 after reset.

Copyright © 2015–2019, Texas Instruments Incorporated

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock-gating control signal to enable or disable the clock. DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. The PRCM module provides a CM_IDLEST_DPLL_dpll_name[0] ST_DPLL_CLK status bit, which indicates the lock state or nonlock state of the DPLL.

The type B DPLL (DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkdcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkdcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- M2 is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as previously identified. CLKDCOLDO does not support bypass mode.

The type B DPLL output clock is synthesized by an internal oscillator that is phase-locked to the REF_CLK. Two oscillators are built within a type B DPLL. The oscillators are user-selectable based on the synthesized output clock frequency requirement. If the required frequency is greater than or equal to 1500 MHz, the user must program a value of 1 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 100 on the SELFREQDCO input of the corresponding type B DPLL. If the required frequency is less than 1500 MHz, the user must program a value of 0 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 010 on the SELFREQDCO input of the corresponding type B DPLL.

3.6.3.3.3 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a manual mode control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode, the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The type A DPLLs can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software-enabled using the low-power mode control bit of the DPLL.

It must be enabled only if both of the following operating conditions are satisfied:

- $F_{ref} / (N + 1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M / (N + 1)$ is less than or equal to 100 MHz.

Where:

- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.4 DPLL Power Modes

DPLL supports several power modes for type A and only one power mode for type B. Each mode results in a tradeoff between power savings and relock time. The PRCM module allows only a few modes for each DPLL, depending on the use of the DPLL.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-45 lists the DPLL power modes.

Table 3-45. DPLL Power Modes

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Low-power bypass	Bypass clock/clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock bypass	Bypass clock/clock stopped	0.065 (leakage)	0.5 (leakage)	0.05 µs + (70 × (N+1) / F_{ref})	0.05 µs + (120 × (N+1) / F_{ref})
Lock	Synthesized clock	0.95 (active)	3 (active)	N/A	N/A

Where:

- F_{ref} is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to another as a result of the following:

- Software-programmed transition (manual): Software configures the dedicated DPLL manual mode control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than the LOCK state) when the output clocks are gated or the destination clock domain is inactive, and to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in the dedicated Auto Mode Control parameter of the DPLL.

NOTE: With T_{ref} = 1 / F_{ref} = (N + 1) / CLKINP; (Fref = CLKINP / (N + 1)):

T_{ref} is the REF_CLK period.

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
- Results in a higher DPLL lock frequency, and then higher power consumption.

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
- An automatic transition can be performed from lock mode to any low-power mode.

NOTE: When the DPLL is in Low-Power bypass mode, Auto-idle mode is disabled and no clock is requested, the DPLL makes a transition to Low-power stop mode.

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.3.3.5 DPLL Recalibration

The DPLL recalibration applies only to type-A DPLLs. Each time the DPLL is reset or performs a lock sequence (following a change in the value of multiplier M or divider N), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In lock mode, the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in lock mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
- If the DPLL drifts out of the operating range limits while not locked, and then when it tries to relock, it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the recalibration-enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory EMIF controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the processor power domain, followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-46 lists the DPLL recalibration and control parameters.

Table 3-46. DPLL Recalibration Control Parameters

Parameter	Register	Description
Recalibration-enable control	CM_CLKMODE_DPLL_<module>[8] DPLL_DRIFTGUARD_EN	Enable/disable the DPLL automatic recalibration feature.
Recalibration-interrupt mask control	PRM_IRQENABLE_MPU PRM_IRQENABLE_MPU_2 PRM_IRQENABLE_IPU1 PRM_IRQENABLE_IPU2 PRM_IRQENABLE_DSP1	Mask/unmask the DPLL recalibration interrupt to processor.

Parameter	Register	Description
Recalibration-interrupt status	PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2 PRM_IRQSTATUS_IPU1 PRM_IRQSTATUS_IPU2 PRM_IRQSTATUS_DSP1	Status of the DPLL recalibration interrupt to processor

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically reenables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Table 3-47. DPLL Power-Down Control Parameters

Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if all output dividers are powered down.

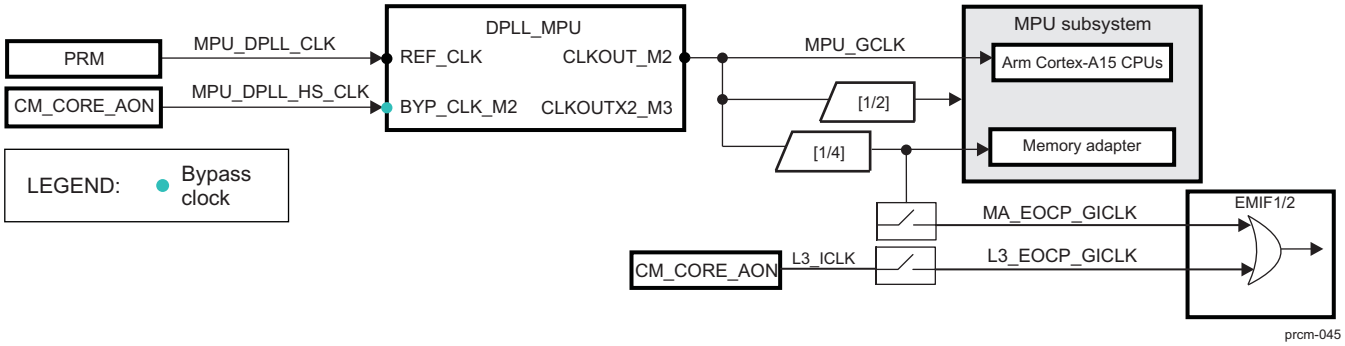
3.6.3.7 DPLL_MPU Description

3.6.3.7.1 DPLL_MPU Overview

Figure 3-49 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-49. DPLL_MPU Overview



3.6.3.7.2 DPLL_MPU Tactical Clocking Adjustment

Figure 3-49 includes the clocking adjustment scheme for DPLL_MPU. Another clock is requested by the EMIF1/2 modules and this clock must be dynamically switched between L3_EOCP_GICLK clock and MA_EOCP_GICLK clock coming from the MPU subsystem (namely from Memory Adapter part of it), depending on the respective activity of MPU and EMIF clock domain.

3.6.3.7.3 DPLL_MPU Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-63 lists the clock synthesis parameters of the DPLL.

Table 3-63. DPLL_MPU Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_MPU[6:0] DPLL_DIV

Table 3-64 lists the clock output divider parameters of the DPLL.

Table 3-64. DPLL_MPU Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_MPU[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_MPU[4:0] DIVHS
CLKOUT_M2 - DCC	DCC feature control	CM_CLKSEL_DPLL_MPU[22] DCC_EN

3.6.3.7.4 DPLL_MPU Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes, and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-65 lists the operating modes supported by the DPLL.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-65. DPLL_MPU Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-66 lists the control bit fields for the operating mode control of the DPLL.

Table 3-66. DPLL_MPU Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

NOTE: The user software must ensure that the MPU voltage domain is on before programming DPLL_MPU. This can be ensured by performing a forced wakeup (CLKCTRL= SW_WKUP) on MPU domain. When software detects that the domain is "ON", DPLL_MPU can be programmed.

3.6.3.7.5 DPLL_MPU Recalibration

Table 3-67 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-67. DPLL_MPU Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[1] DPLL_MPU_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU1[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU1[1] DPLL_MPU_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU2[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU2[1] DPLL_MPU_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP1[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[1] DPLL_MPU_RECAL_EN

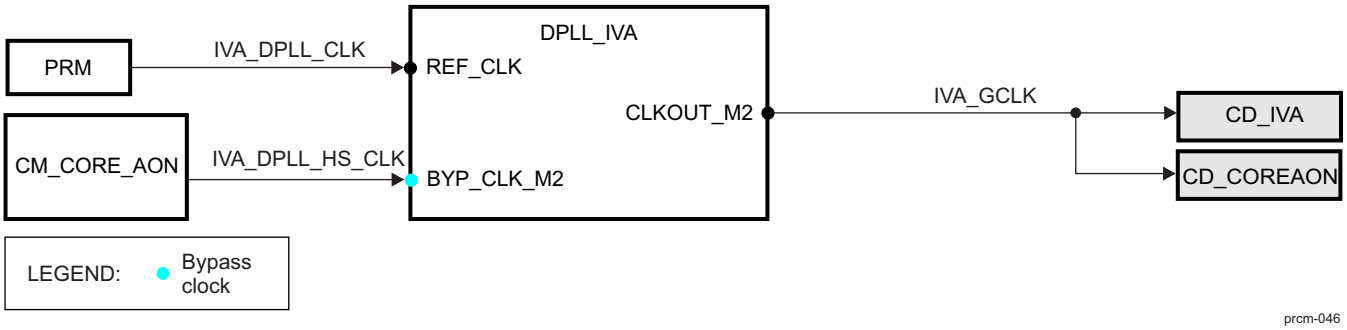
3.6.3.8 DPLL_IVA Description

3.6.3.8.1 DPLL_IVA Overview

Figure 3-50 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-50. DPLL_IVA Overview



3.6.3.8.2 DPLL_IVA Synthesized Clock Parameters

This section describes the clock synthesis and clock-out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-68 lists the clock synthesis parameters of the DPLL.

Table 3-68. DPLL_IVA Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_IVA[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_IVA[6:0] DPLL_DIV

Table 3-69 lists the clock output divider parameters of the DPLL.

Table 3-69. DPLL_IVA Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_IVA[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_IVA[4:0] DIVHS

3.6.3.8.3 DPLL_IVA Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-70 lists the operating modes supported by the DPLL.

Table 3-70. DPLL_IVA Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-71 lists the control bit fields for the operating mode control of the DPLL.

Table 3-71. DPLL_IVA Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_IVA[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_IVA[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_IVA[2:0] AUTO_DPLL_MODE

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.3.8.4 DPLL_IVA Recalibration

Table 3-72 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-72. DPLL_IVA Recalibration Feature Parameters

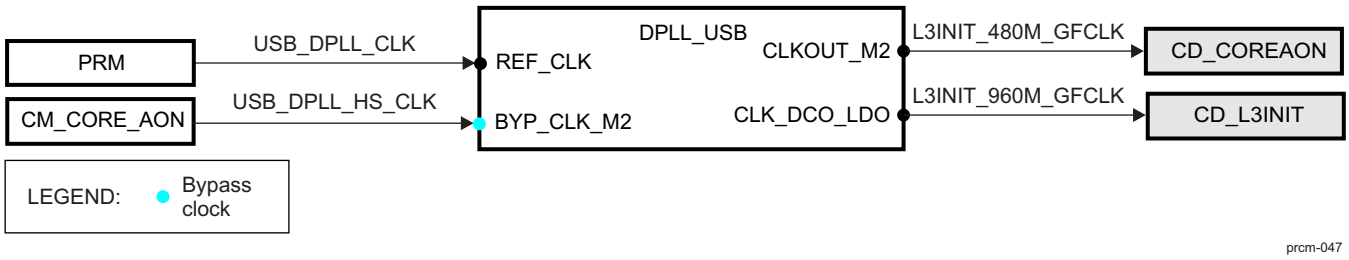
Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_IVA[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU1[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU1[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU2[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU2[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP1[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[2] DPLL_IVA_RECAL_EN

3.6.3.9 DPLL_USB Description

3.6.3.9.1 DPLL_USB Overview

Figure 3-51 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-51. DPLL_USB Overview



3.6.3.9.2 DPLL_USB Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-73 lists the clock synthesis parameters of the DPLL.

Table 3-73. DPLL_USB Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_USB[19:8] DPLL_MULT
N	CM_CLKSEL_DPLL_USB[7:0] DPLL_DIV

Table 3-74 lists the clock output divider parameters of the DPLL.

Table 3-74. DPLL_USB Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_USB[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_USB[6:0] DIVHS

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-74. DPLL_USB Clock Output Parameters (continued)

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLK_DCO_LDO	DCO output control	CM_CLKSEL_DPLL_USB[21] DPLL_SELFREQDCO

3.6.3.9.3 DPLL_USB Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-75 lists the operating modes supported by the DPLL.

Table 3-75. DPLL_USB Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Available	Not available	Available	Not available	Available

Table 3-76 lists the control bit fields for the operating mode control of the DPLL.

Table 3-76. DPLL_USB Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_USB[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE

3.6.3.9.4 DPLL_USB Recalibration

Table 3-77 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-77. DPLL_USB Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[13] DPLL_USB_RECAL_EN(1)

(1) DPLL_USB recalibration feature is not supported on the AM571x and AM570x family of devices.

3.6.3.10 DPLL_DSP Description

3.6.3.10.1 DPLL_DSP Overview

Figure 3-52 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-52. DPLL_DSP Overview

Table 3-101 lists the control bit fields for the operating mode control of the DPLL.

Table 3-101. DPLL_PCIE_REF Mode Control Parameters

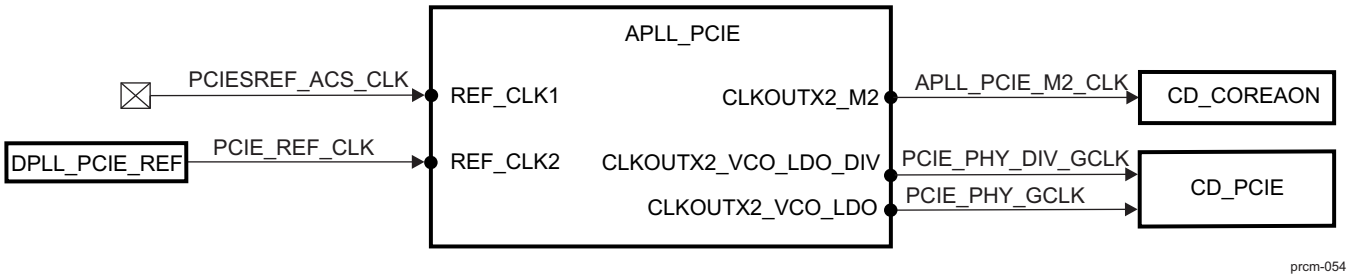
Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_PCIE_REF[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_PCIE_REF[2:0] AUTO_DPLL_MODE

3.6.3.15 APLL_PCIE Description

3.6.3.15.1 APLL_PCIE Overview

Figure 3-57 is an overview of the APLL. For a functional overview of a generic APLL module, see Section 3.6.3.3.1, *Generic APLL Overview*.

Figure 3-57. APLL_PCIE Overview



3.6.3.15.2 APLL_PCIE Synthesized Clock Parameters

This section lists the clock synthesis and clock out divider parameters of the APLL.

Table 3-102 lists the clock output divider parameters of the APLL.

Table 3-102. APLL_PCIE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_APLL_PCIE[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_APLL_PCIE[6:0] DIVHS
CLKOUTX2_VCO_LDO_DIV	Status	CM_CLKVCOLDO_APLL_PCIE[10] CLK_DIVST
CLKOUTX2_VCO_LDO	Status	CM_CLKVCOLDO_APLL_PCIE[9] CLKST

3.6.3.15.3 APLL_PCIE Power Modes

This section identifies the operating modes supported by the APLL and the control bit fields to set its operating modes.

NOTE: In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. Please note that setting CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE.

Table 3-100 lists the operating modes supported by the DPLL.

Table 3-103. APLL_PCIE Modes

Auto Idle	Force Lock
Available	Available

Table 3-104 lists the control bit fields for the operating mode control of the APLL.

Table 3-104. APLL_PCIE Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT

3.6.4 Clock Domains

In this sections are summarized and described all Clock Domains in the device.

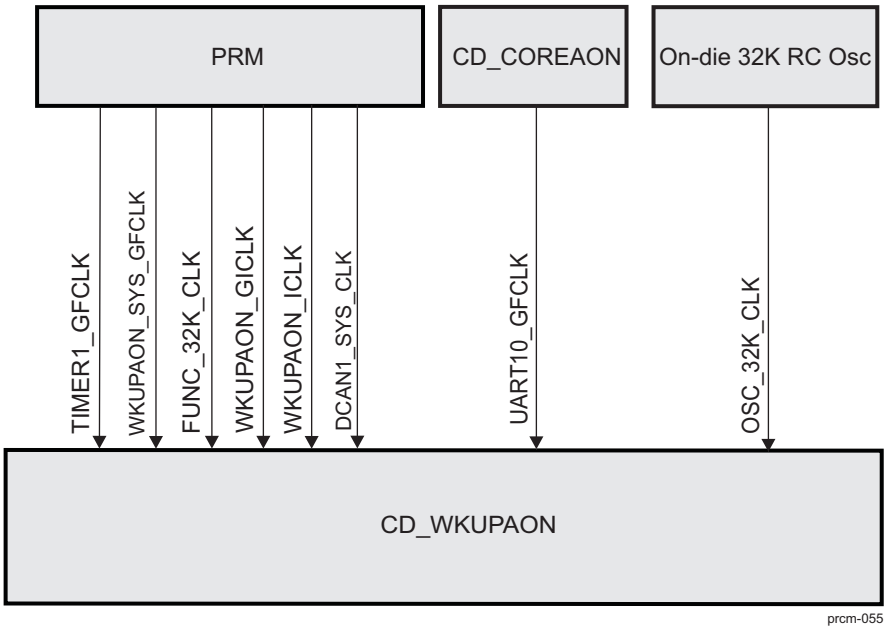
3.6.4.1 CD_WKUPAON Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1.1 CD_WKUPAON Overview

Figure 3-58 is an overview of the clock domain.

Figure 3-58. CD_WKUPAON Overview



NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.4.1.2 CD_WKUPAON Clock Domain Modes

Table 3-105 lists the clock domain modes supported by the clock domain.

Table 3-105. CD_WKUPAON Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-106 lists the clock domain state transition control and status bits for the clock in this clock domain

Table 3-106. CD_WKUPAON Control and Status Parameters

Parameter Name	Control/Status Bit Field
WKUPAON_GICLK Clock Status	CM_WKUPAON_CLKSTCTRL[12] CLKACTIVITY_WKUPAON_GICLK
SYS_CLK Clock Status; includes profiling EMU_SYS_CLK and all functional SYS_CLK	CM_WKUPAON_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
SYS_CLK Clock Status of functional branches, exclude activity of the EMU_SYS_GCLK clock	CM_WKUPAON_CLKSTCTRL[14] CLKACTIVITY_SYS_CLK_FUNC
WKUPAON_SYS_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[11] CLKACTIVITY_WKUPAON_SYS_GFCLK
WKUPAON_32K_GFCLK Clock Control for GPIO1	CM_WKUPAON_GPIO1_CLKCTRL[8] OPTFCLKEN_DBCLK
DCAN1_SYS_CLK Clock Status	CM_WKUPAON_CLKSTCTRL[16] CLKACTIVITY_DCAN1_SYS_CLK
TIMER1_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[17] CLKACTIVITY_TIMER1_GFCLK
UART10_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[18] CLKACTIVITY_UART10_GFCLK
Clock Domain State Transition Control	CM_WKUPAON_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.1.3 CD_WKUPAON Clock Domain Dependency

CD_WKUPAON has no static dependency or dynamic dependency with any other clock domain of the device.

3.6.4.1.3.1 CD_WKUPAON Wake-Up Dependency

Table 3-107 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-107. CD_WKUPAON Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPIO1	CD_WKUPAON	CD_DSP1	Disabled	PM_WKUPAON_GPIO1_WKDEP[2] WKUPDEP_GPIO1_IRQ1_DSP1	Read/write

Table 3-129 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-129. CD_MPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3MAIN1	Always enabled	CM_MPU_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_EMIF	Always enabled	CM_MPU_DYNAMICDEP[4] EMIF_DYNDEP	Read only

3.6.4.4.4 CD_MPU Clock Domain Module Attributes

Table 3-130 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-130. CD_MPU Modules Clocks Association

Module	Clock	Clock Type
MPU	MPU_GCLK	Interface and functional

Table 3-131 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-131. CD_MPU Modules Wake-Up Request

Module	Wake-Up Feature
MPU	Master wake-up request

Table 3-132 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-132. CD_MPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
MPU	Master/slave	CM_MPU_MPU_CLKCTRL[18] STBYST	Standby status
		CM_MPU_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-133 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-133. CD_MPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
MPU	N/A	Available	N/A	CM_MPU_MPU_CLKCTRL[1:0] MODULEMODE	Read only

3.6.4.5 CD_L4PER1 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.5.1 CD_L4PER1 Overview

Figure 3-62 is an overview of the clock domain.

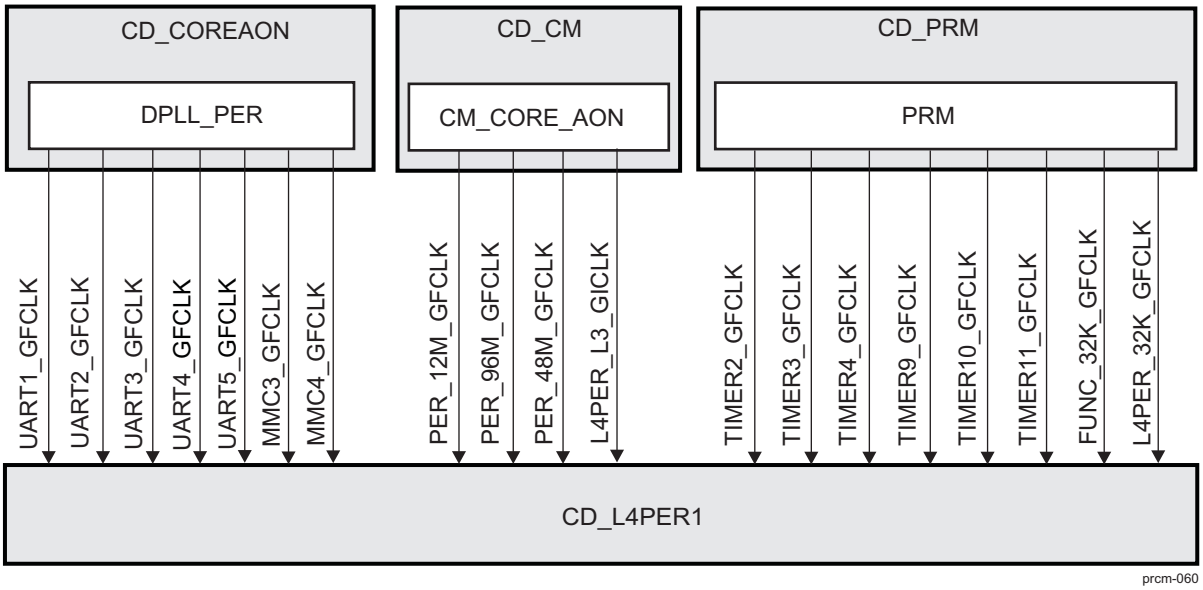
Figure 3-62. CD_L4PER1 Overview



3.6.4.5.2 CD_L4PER1 Clock Domain Modes

Table 3-134 lists the clock domain modes supported by the clock domain.

Table 3-134. CD_L4PER1 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-135 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-135. CD_L4PER1 Control and Status Parameters

Parameter Name	Control/Status Bit Field
TIMER10_GFCLK clock status	CM_L4PER_CLKSTCTRL[9] CLKACTIVITY_TIMER10_GFCLK
TIMER11_GFCLK clock status	CM_L4PER_CLKSTCTRL[10] CLKACTIVITY_TIMER11_GFCLK
TIMER2_GFCLK clock status	CM_L4PER_CLKSTCTRL[11] CLKACTIVITY_TIMER2_GFCLK
TIMER3_GFCLK clock status	CM_L4PER_CLKSTCTRL[12] CLKACTIVITY_TIMER3_GFCLK
TIMER4_GFCLK clock status	CM_L4PER_CLKSTCTRL[13] CLKACTIVITY_TIMER4_GFCLK
TIMER9_GFCLK clock status	CM_L4PER_CLKSTCTRL[14] CLKACTIVITY_TIMER9_GFCLK
L4PER_L3_GICLK clock status	CM_L4PER_CLKSTCTRL[8] CLKACTIVITY_L4PER_L3_GICLK
PER_12M_GFCLK clock status	CM_L4PER_CLKSTCTRL[19] CLKACTIVITY_PER_12M_GFCLK
L4PER_32K_GFCLK clock status	CM_L4PER_CLKSTCTRL[27] CLKACTIVITY_L4PER_32K_GFCLK
PER_48M_GFCLK clock status	CM_L4PER_CLKSTCTRL[20] CLKACTIVITY_PER_48M_GFCLK
PER_96M_GFCLK clock status	CM_L4PER_CLKSTCTRL[21] CLKACTIVITY_PER_96M_GFCLK
GPIO_GFCLK clock status	CM_L4PER_CLKSTCTRL[24] CLKACTIVITY_GPIO_GFCLK
UART1_GFCLK clock status	CM_L4PER_CLKSTCTRL[15] CLKACTIVITY_UART1_GFCLK
UART2_GFCLK clock status	CM_L4PER_CLKSTCTRL[16] CLKACTIVITY_UART2_GFCLK
UART3_GFCLK clock status	CM_L4PER_CLKSTCTRL[17] CLKACTIVITY_UART3_GFCLK
UART4_GFCLK clock status	CM_L4PER_CLKSTCTRL[18] CLKACTIVITY_UART4_GFCLK

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-135. CD_L4PER1 Control and Status Parameters (continued)

Parameter Name	Control/Status Bit Field
UART5_GFCLK clock status	CM_L4PER_CLKSTCTRL[26] CLKACTIVITY_UART5_GFCLK
MMC3_GFCLK clock status	CM_L4PER_CLKSTCTRL[22] CLKACTIVITY_MMC3_GFCLK
MMC4_GFCLK clock status	CM_L4PER_CLKSTCTRL[23] CLKACTIVITY_MMC4_GFCLK
Clock Domain State Transition Control	CM_L4PER_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.5.3 CD_L4PER1 Clock Domain Dependency

CD_L4PER1 has no static dependency with any other clock domain of the device.

3.6.4.5.3.1 CD_L4PER1 Dynamic Dependency

Table 3-136 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-136. CD_L4PER1 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4SEC	Always enabled	CM_L4PER_DYNAMICDEP[14] L4SEC_DYNDEP	Read only
CD_DSS	Always enabled	CM_L4PER_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_IPU	Always enabled	CM_L4PER_DYNAMICDEP[3] IPU_DYNDEP	Read only

3.6.4.5.3.2 CD_L4PER1 Wake-Up Dependency

Table 3-137 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-137. CD_L4PER1 Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
TIMER10	CD_L4PER	CD_MPU, CD_L3_MAIN1, CD_L4PER1, CD_L4PER2, CD_L4PER3	Disabled	PM_L4PER_TIMER10_WKDEP[0] WKUPDEP_TIMER10_MPU	Read/write

3.6.4.5.4 CD_L4PER1 Clock Domain Module Attributes

Table 3-138 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-138. CD_L4PER1 Modules Clocks Association

Module	Clock	Clock Type
TIMER10	TIMER10_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
TIMER11	TIMER11_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
TIMER2	TIMER2_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
TIMER3	TIMER3_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
TIMER4	TIMER4_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
TIMER9	TIMER9_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
ELM	L4PER_L3_GICLK	Interface[1]
GPIO2	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
GPIO3	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
GPIO4	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
GPIO5	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
GPIO6	GPIO_GFCLK	Functional

GPIO8	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
HDQ1W	L4PER_L3_GICLK	Interface[1]
	PER_12M_GFCLK	Functional
I2C1	L4PER_L3_GICLK	Interface[1]
	PER_96M_GFCLK	Functional
I2C2	L4PER_L3_GICLK	Interface[1]
	PER_96M_GFCLK	Functional
I2C3	L4PER_L3_GICLK	Interface[1]
	PER_96M_GFCLK	Functional
I2C4	L4PER_L3_GICLK	Interface[1]
	PER_96M_GFCLK	Functional
L4_PER1 interconnect	L4PER_L3_GICLK	Interface[1]
MCSPI1	L4PER_L3_GICLK	Interface[1]
	PER_48M_GFCLK	Functional
MCSPI2	L4PER_L3_GICLK	Interface[1]
	PER_48M_GFCLK	Functional
MCSPI3	L4PER_L3_GICLK	Interface[1]
	PER_48M_GFCLK	Functional
MCSPI4	L4PER_L3_GICLK	Interface[1]
	PER_48M_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-138. CD_L4PER1 Modules Clocks Association (continued)

Module	Clock	Clock Type
MMC3	L4PER_32K_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
	MMC3_GFCLK	Functional
MMC4	L4PER_32K_GFCLK	Functional
	L4PER_L3_GICLK	Interface[1]
	MMC4_GFCLK	Functional
UART1	L4PER_L3_GICLK	Interface[1]
	UART1_GFCLK	Functional
UART2	L4PER_L3_GICLK	Interface[1]
	UART2_GFCLK	Functional
UART3	L4PER_L3_GICLK	Interface[1]
	UART3_GFCLK	Functional
UART4	L4PER_L3_GICLK	Interface[1]
	UART4_GFCLK	Functional
UART5	L4PER_L3_GICLK	Interface[1]
	UART5_GFCLK	Functional

Table 3-139 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-139. CD_L4PER1 Modules Wake-Up Request

Module	Wake-Up Feature
TIMER10	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER11	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER9	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
ELM	None
GPIO2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO5	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO6	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO7	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
GPIO8	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
HDQ1W	None
I2C1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ DMA_SYSTEM-DMA)

Table 3-139. CD_L4PER1 Modules Wake-Up Request (continued)

Module	Wake-Up Feature
I2C2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ DMA_SYSTEM-DMA)
I2C3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ DMA_SYSTEM-DMA)
I2C4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ DMA_SYSTEM-DMA)
L4_PER1 interconnect	None
MCSPI1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
MCSPI2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
MCSPI3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
MCSPI4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
MMC3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
MMC4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
UART1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
UART2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
UART3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
UART4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
UART5	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)

Table 3-140 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-140. CD_L4PER1 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
TIMER10	Slave	CM_L4PER_TIMER10_CLKCTRL [17:16] IDLEST	Idle status
TIMER11	Slave	CM_L4PER_TIMER11_CLKCTRL [17:16] IDLEST	Idle status
TIMER2	Slave	CM_L4PER_TIMER2_CLKCTRL[17:16] IDLEST	Idle status
TIMER3	Slave	CM_L4PER_TIMER3_CLKCTRL[17:16] IDLEST	Idle status
TIMER4	Slave	CM_L4PER_TIMER4_CLKCTRL[17:16] IDLEST	Idle status

3.6.4.6 CD_L4PER2 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.6.1 CD_L4PER2 Overview

Figure 3-63 is an overview of the clock domain.

Figure 3-63. CD_L4PER2 Overview

3.6.4.6.2 CD_L4PER2 Clock Domain Modes

Table 3-142 lists the clock domain modes supported by the clock domain.

Table 3-142. CD_L4PER2 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-143 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-143. CD_L4PER2 Control and Status Parameters

Parameter Name	Control/Status Bit Field
ICSS_CLK clock status	CM_L4PER2_CLKSTCTRL[8] CLKACTIVITY_ICSS_CLK
ICSS_IEP_CLK clock status	CM_L4PER2_CLKSTCTRL[14] CLKACTIVITY_ICSS_IEP_CLK
UART7_GFCLK clock status	CM_L4PER2_CLKSTCTRL[9] CLKACTIVITY_UART7_GFCLK
UART8_GFCLK clock status	CM_L4PER2_CLKSTCTRL[10] CLKACTIVITY_UART8_GFCLK
UART9_GFCLK clock status	CM_L4PER2_CLKSTCTRL[11] CLKACTIVITY_UART9_GFCLK
I2C6	None
QSPI_GFCLK clock status	CM_L4PER2_CLKSTCTRL[12] CLKACTIVITY_QSPI_GFCLK
L4PER2_L3_GICLK clock status	CM_L4PER2_CLKSTCTRL[16] CLKACTIVITY_L4PER2_L3_GICLK
DCAN2_SYS_CLK clock status	CM_L4PER2_CLKSTCTRL[15] CLKACTIVITY_DCAN2_SYS_CLK
PER_192M_GFCLK clock status	CM_L4PER2_CLKSTCTRL[13] CLKACTIVITY_PER_192M_GFCLK
MCASP2_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[17] CLKACTIVITY_MCASP2_AHCLKX
MCASP2_AHCLKR clock status	CM_L4PER2_CLKSTCTRL[18] CLKACTIVITY_MCASP2_AHCLKR
MCASP2_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[19] CLKACTIVITY_MCASP2_AUX_GFCLK
MCASP3_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[20] CLKACTIVITY_MCASP3_AHCLKX
MCASP3_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[21] CLKACTIVITY_MCASP3_AUX_GFCLK
MCASP4_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[22] CLKACTIVITY_MCASP4_AHCLKX
MCASP4_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[23] CLKACTIVITY_MCASP4_AUX_GFCLK
MCASP5_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[25] CLKACTIVITY_MCASP5_AHCLKX
MCASP5_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[24] CLKACTIVITY_MCASP5_AUX_GFCLK
MCASP6_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[26] CLKACTIVITY_MCASP6_AHCLKX
MCASP6_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[27] CLKACTIVITY_MCASP6_AUX_GFCLK
MCASP7_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[28] CLKACTIVITY_MCASP7_AHCLKX
MCASP7_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[29] CLKACTIVITY_MCASP7_AUX_GFCLK
MCASP8_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[30] CLKACTIVITY_MCASP8_AHCLKX
MCASP8_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[31] CLKACTIVITY_MCASP8_AUX_GFCLK
Clock Domain State Transition Control	CM_L4PER2_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.6.3 CD_L4PER2 Clock Domain Dependency

CD_L4PER2 has no static dependency with any other clock domain of the device.

3.6.4.6.3.1 CD_L4PER2 Dynamic Dependency

Table 3-144 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-144. CD_L4PER2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_CFG	Always enabled	CM_L4PER2_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER2_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_IPU	Always enabled	CM_L4PER2_DYNAMICDEP[3] IPU_DYNDEP	Read only
CD_ATL	Always enabled	CM_L4PER2_DYNAMICDEP[6] ATL_DYNDEP	Read only
CD_GMAC	Always enabled	CM_L4PER2_DYNAMICDEP[22] GMAC_DYNDEP	Read only

3.6.4.6.3.2 CD_L4PER2 Wake-Up Dependency

Table 3-145 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-145. CD_L4PER2 Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
UART7	CD_L4PER2	CD_SDMA, CD_L3_MAIN1, CD_L4PER1, CD_L4PER2, CD_L4PER3	Disabled	PM_L4PER2_UART7_WKDEP[3] WKUPDEP_UART7_SDMA	Read/write
UART7	CD_L4PER2	CD_MPU, CD_L3_MAIN1, CD_L4PER1, CD_L4PER2, CD_L4PER3	Disabled	PM_L4PER2_UART7_WKDEP[0] WKUPDEP_UART7_MPU	Read/write

3.6.4.6.4 CD_L4PER2 Clock Domain Module Attributes

Table 3-146 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-146. CD_L4PER2 Modules Clocks Association

Module	Clock	Clock Type
L4_PER2 interconnect	L4PER2_L3_GICLK	Interface(1)
DCAN2	L4PER2_L3_GICLK	Interface
	DCAN2_SYS_CLK	Functional
MCASP2	L4PER2_L3_GICLK	Interface(1)
	MCASP2_AHCLKR	Functional
	MCASP2_AHCLKX	Functional
	MCASP2_AUX_GFCLK	Functional
MCASP3	L4PER2_L3_GICLK	Interface(1)
	MCASP3_AHCLKX	Functional
	MCASP3_AUX_GFCLK	Functional
MCASP4	L4PER2_L3_GICLK	Interface(1)
	MCASP4_AHCLKX	Functional
	MCASP4_AUX_GFCLK	Functional
MCASP5	L4PER2_L3_GICLK	Interface(1)
	MCASP5_AHCLKX	Functional
	MCASP5_AUX_GFCLK	Functional
MCASP6	L4PER2_L3_GICLK	Interface(1)
	MCASP6_AHCLKX	Functional
	MCASP6_AUX_GFCLK	Functional
MCASP7	L4PER2_L3_GICLK	Interface(1)
	MCASP7_AHCLKX	Functional
	MCASP7_AUX_GFCLK	Functional
MCASP8	L4PER2_L3_GICLK	Interface(1)
	MCASP8_AHCLKX	Functional
	MCASP8_AUX_GFCLK	Functional
PRU-ICSS1	ICSS_CLK	Interface
	ICSS_IEP_CLK	Functional
	PER_192M_GFCLK	Functional
PRU-ICSS2	ICSS_CLK	Interface
	ICSS_IEP_CLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER2_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-146. CD_L4PER2 Modules Clocks Association (continued)

Module	Clock	Clock Type
	PER_192M_GFCLK	Functional
QSPI	L4PER2_L3_GICLK	Interface
	QSPI_GFCLK	Functional
PWMSS1	L4PER2_L3_GICLK	Interface(1) and Functional(2)
PWMSS2	L4PER2_L3_GICLK	Interface(1) and Functional(2)
PWMSS3	L4PER2_L3_GICLK	Interface(1) and Functional(2)
UART7	L4PER2_L3_GICLK	Interface(1)
	UART7_GFCLK	Functional
UART8	L4PER2_L3_GICLK	Interface(1)
	UART8_GFCLK	Functional
UART9	L4PER2_L3_GICLK	Interface(1)
	UART9_GFCLK	Functional
I2C6	L4PER2_L3_GICLK	Interface(1)
	PER_96M_GFCLK	Functional

(2) The module functional clock is equal to L4PER2_L3_GICLK/2.

Table 3-147 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-147. CD_L4PER2 Modules Wake-Up Request

Module	Wake-Up Feature
L4_PER2 interconnect	None
DCAN2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ,DMA_SYSTEM-DMA)

3.6.4.7.3 CD_L4PER3 Clock Domain Dependency

CD_L4PER3 has no static dependency with any other clock domain of the device.

3.6.4.7.3.1 CD_L4PER3 Dynamic Dependency

Table 3-152 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-152. CD_L4PER3 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_CFG	Always enabled	CM_L4PER3_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER3_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_IPU	Always enabled	CM_L4PER3_DYNAMICDEP[3] IPU_DYNDEP	Read only
CD_L3MAIN1	Always enabled	CM_L4PER3_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_RTC	Always enabled	CM_L4PER3_DYNAMICDEP[23] RTC_DYNDEP	Read only
CD_CAM	Always enabled	CM_L4PER3_DYNAMICDEP[9] CAM_DYNDEP	Read only
CD_VPE	Always enabled	CM_L4PER3_DYNAMICDEP[31] VPE_DYNDEP	Read only

3.6.4.7.3.2 CD_L4PER3 Wake-Up Dependency

CD_L4PER3 has no module wake-up dependency with any other clock domain of the device.

3.6.4.7.4 CD_L4PER3 Clock Domain Module Attributes

Table 3-153 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-153. CD_L4PER3 Modules Clocks Association

Module	Clock	Clock Type
L4_PER3 interconnect	L4PER3_L3_GICLK	Interface(1)
TIMER13	L4PER3_L3_GICLK	Interface(1)
	TIMER13_GFCLK	Functional
TIMER14	L4PER3_L3_GICLK	Interface(1)
	TIMER14_GFCLK	Functional
TIMER15	L4PER3_L3_GICLK	Interface(1)
	TIMER15_GFCLK	Functional
TIMER16	L4PER3_L3_GICLK	Interface(1)
	TIMER16_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER3_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-154 lists the supported wake-up request generation capability for each module of the clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-154. CD_L4PER3 Modules Wake-Up Request

Module	Wake-Up Feature
L4_PER3 interconnect	None
TIMER13	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER14	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER15	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
TIMER16	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)

Table 3-155 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-155. CD_L4PER3 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L4_PER3 interconnect	Slave	CM_L4PER3_L4_PER3_CLKCTRL[17:16] IDLEST	Idle status
TIMER13	Slave	CM_L4PER3_TIMER13_CLKCTRL[17:16] IDLEST	Idle status
TIMER14	Slave	CM_L4PER3_TIMER14_CLKCTRL[17:16] IDLEST	Idle status
TIMER15	Slave	CM_L4PER3_TIMER15_CLKCTRL[17:16] IDLEST	Idle status
TIMER16	Slave	CM_L4PER3_TIMER16_CLKCTRL[17:16] IDLEST	Idle status

Table 3-156 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-156. CD_L4PER3 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L4_PER3 interconnect	N/A	Available	N/A	CM_L4PER3_L4_PER3_CLKCTRL[1:0] MODULEMODE	Read only
TIMER13	Available	N/A	Available	CM_L4PER3_TIMER13_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER14	Available	N/A	Available	CM_L4PER3_TIMER14_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER15	Available	N/A	Available	CM_L4PER3_TIMER15_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER16	Available	N/A	Available	CM_L4PER3_TIMER16_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.8 CD_L4SEC Clock Domain

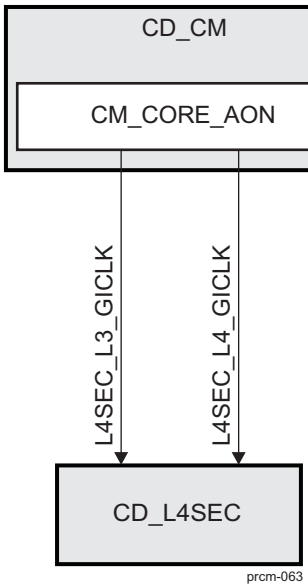
This section identifies the modes supported by the clock domain, the associated control, and status bits. It also identifies the dependencies of the domain with the other clock domains of the device.

3.6.4.8.1 CD_L4SEC Overview

Figure 3-65 shows an overview of the clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-65. CD_L4SEC Overview



3.6.4.8.2 CD_L4SEC Clock Domain Modes

Table 3-157 lists the clock domain modes supported by the clock domain.

Table 3-157. CD_L4SEC Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-158 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-158. CD_L4SEC Control and Status Parameters

Parameter Name	Control/Status Bit Field
L4SEC_L3_GICLK clock status	CM_L4SEC_CLKSTCTRL[8] CLKACTIVITY_L4SEC_L3_GICLK
Clock Domain State Transition Control	CM_L4SEC_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.8.3 CD_L4SEC Clock Domain Dependency

CD_L4SEC has no module wake-up dependency with any other clock domain of the device.

3.6.4.8.3.1 CD_L4SEC Static Dependency

Table 3-159 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-159. CD_L4SEC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4PER1	Disabled	CM_L4SEC_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_L3_MAIN1	Always enabled	CM_L4SEC_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_L4SEC_STATICDEP[4] EMIF_STATDEP	Read/Write

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.4.8.3.2 CD_L4SEC Dynamic Dependency

Table 3-160 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-160. CD_L4SEC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Disabled	CM_L4SEC_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.8.4 CD_L4SEC Clock Domain Module Attributes

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- FPKA
- DMA_CRYPTO

Table 3-161 lists the clocks received by each module of the clock domain and the role (that is, functional clock or interface clock).

Table 3-161. CD_L4SEC Modules Clocks Association

Module	Clock	Clock Type
AES1	L4SEC_L3_GICLK	Interface
AES2	L4SEC_L3_GICLK	Interface
SHA2MD5_1	L4SEC_L3_GICLK	Interface
SHA2MD5_2	L4SEC_L3_GICLK	Interface
CryptoDMA	L4SEC_L3_GICLK	Interface(1) and Functional
DES3DES	L4SEC_L3_GICLK	Interface(1)
RNG	L4SEC_L3_GICLK	Interface(1)
FPKA	L4SEC_L3_GICLK	Interface(1) and Functional(2)

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4SEC_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

(2) The module's functional clock is equal to L4SEC_L3_GICLK/2.

Table 3-162 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-162. CD_L4SEC Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
AES1	Slave	CM_L4SEC_AES1_CLKCTRL[17:16] IDLEST	Idle status
AES2	Slave	CM_L4SEC_AES2_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5_1	Slave	CM_L4SEC_SHA2MD51_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5_2	Slave	CM_L4SEC_SHA2MD52_CLKCTRL[17:16] IDLEST	Idle status

3.6.4.9.4 CD_L3INIT Clock Domain Module Attributes

Table 3-169 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-169. CD_L3INIT Modules Clocks Association

Module	Clock	Clock Type
MMC1	MMC1_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
MMC2	MMC2_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
USB1	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
	USB_LFPS_TX_GFCLK	Interface
USB2	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB3	L3INIT_L3_GICLK	Interface
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB2PHY1	COREAON_32K_GFCLK	Functional
USB2PHY2	COREAON_32K_GFCLK	Functional
USB3_PHY	COREAON_32K_GFCLK	Functional
SATA	L3INIT_L3_GICLK	Interface
	L3INIT_48M_GFCLK	Functional
	SATA_REF_GFCLK	Functional
IEEE1500_2_OCP	L3INIT_L3_GICLK	Interface and functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4INIT_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-180. CD_IVA Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IVA	Available	Available	N/A	CM_IVA_IVA_CLKCTRL[1:0] MODULEMODE	Read/write
SL2	Available	Available	N/A	CM_IVA_SL2_CLKCTRL[1:0] MODULEMODE	Read/write

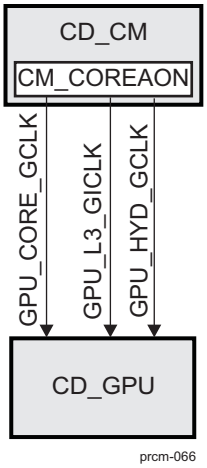
3.6.4.11 CD_GPU Description

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.11.1 CD_GPU Overview

Figure 3-68 is an overview of the clock domain.

Figure 3-68. CD_GPU Overview



3.6.4.11.2 CD_GPU Clock Domain Modes

Table 3-181 lists the clock domain modes supported by the clock domain.

Table 3-181. CD_GPU Clock Domain Modes

Table 3-182 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-182. CD_GPU Control and Status Parameters

Parameter Name	Control/Status Bit Field
GPU_L3_GICLK clock status	CM_GPU_CLKSTCTRL[8] CLKACTIVITY_GPU_L3_GICLK
Select the source of HYD_CLK	CM_GPU_GPU_CLKCTRL[27:26] CLKSEL_HYD_CLK
GPU_CORE_GCLK clock status	CM_GPU_CLKSTCTRL[9] CLKACTIVITY_GPU_CORE_GCLK
Select the source of CORE_CLK	CM_GPU_GPU_CLKCTRL[25:24] CLKSEL_CORE_CLK
GPU_HYD_GCLK clock status	CM_GPU_CLKSTCTRL[10] CLKACTIVITY_GPU_HYD_GCLK
Clock Domain State Transition Control	CM_GPU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.11.3 CD_GPU Clock Domain Dependency

CD_GPU has no module wake-up dependency with any other clock domain of the device.

3.6.4.11.3.1 CD_GPU Static Dependency

Table 3-183 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-183. CD_GPU Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_GPU_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Always enabled	CM_GPU_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_GPU_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.4.11.3.2 CD_GPU Dynamic Dependency

Table 3-184 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-184. CD_GPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Alway disabled	CM_GPU_DYNAMICDEP[6] L3MAIN1_DYNDEP	Read only

3.6.4.11.4 CD_GPU Clock Domain Module Attributes

Table 3-185 identifies for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-185. CD_GPU Modules Clocks Association

Module	Clock	Clock Type
GPU	GPU_L3_GICLK	Interface
	GPU_CORE_GCLK	Functional
	GPU_HYD_GCLK	Functional

Table 3-186 lists the supported wake-up request generation capability for each module of the clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-186. CD_GPU Modules Wake-Up Request

Module	Wake-Up Feature
GPU	None

Table 3-187 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-187. CD_GPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPU	Master/slave	CM_GPU_GPU_CLKCTRL[18] STBYST	Standby status
		CM_GPU_GPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-188 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-188. CD_GPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPU	Available	N/A	Available	CM_GPU_GPU_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.12 CD_EMU Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.12.1 CD_EMU Overview

Figure 3-69 is an overview of the clock domain.

3.6.4.12.4 CD_EMU Clock Domain Module Attributes

Table 3-192 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-192. CD_EMU Modules Clocks Association

Module	Clock	Clock Type
DEBUGSS	EMU_SYS_CLK	Interface and functional

Table 3-193 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-193. CD_EMU Modules Wake-Up Request

Module	Wake-Up Feature
DEBUGSS	Master wake-up request

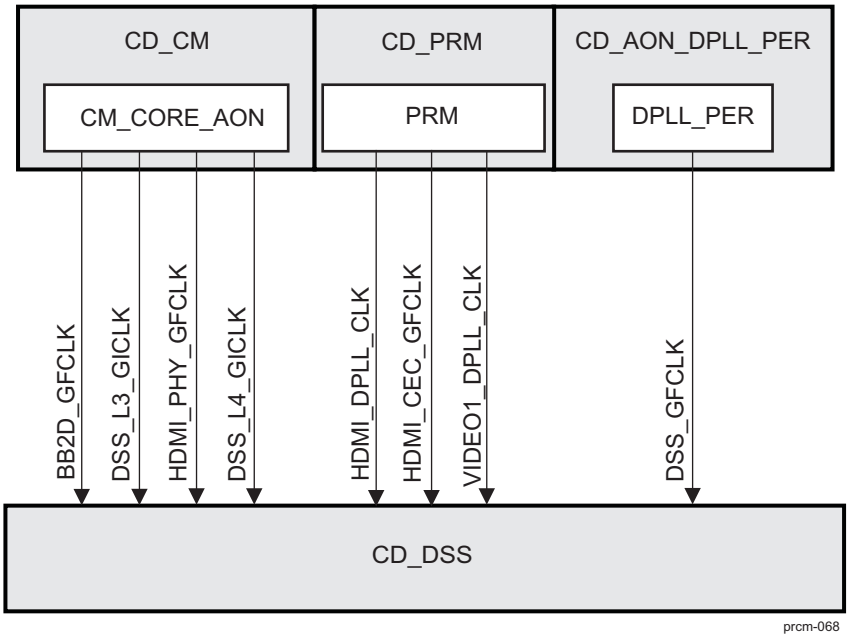
3.6.4.13 CD_DSS Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device. BB2D is a part of CD_DSS clock domain. BB2D_GFCLK is the functional clock for BB2D module. It is derived from H24 post divider of DPLL_CORE.

3.6.4.13.1 CD_DSS Overview

Figure 3-70 is an overview of the clock domain.

Figure 3-70. CD_DSS Overview



3.6.4.13.2 CD_DSS Clock Domain Modes

Table 3-194 lists the clock domain modes supported by the clock domain.

3.6.4.13.4 CD_DSS Clock Domain Module Attributes

Table 3-199 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-199. CD_DSS Modules Clocks Association

Module	Clock	Clock Type
DSS	HDMI_DPLL_CLK	Functional
	DSS_GFCLK	Functional
	HDMI_PHY_GFCLK	Functional
	HDMI_CEC_GFCLK	Functional
	VIDEO1_DPLL_CLK	Functional
	DSS_L3_GICLK	Interface(1)
BB2D	BB2D_GFCLK	Functional
	DSS_L3_GICLK	Interface

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the DSS_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-200 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-200. CD_DSS Modules Wake-Up Request

Module	Wake-Up Feature
DSS	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DMA_SYSTEM-DMA)
BB2D	None

Table 3-201 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-201. CD_DSS Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role

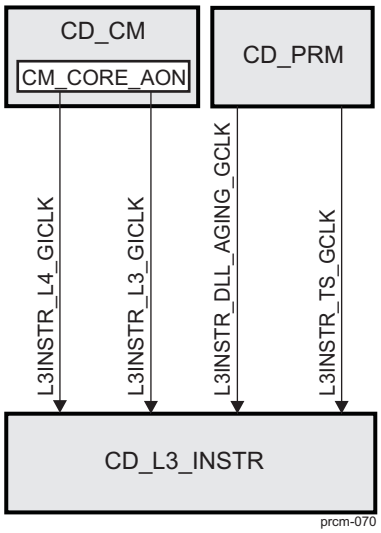
3.6.4.15 CD_L3_INSTR Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.15.1 CD_L3_INSTR Overview

Figure 3-72 is an overview of the clock domain.

Figure 3-72. CD_L3_INSTR Overview



3.6.4.15.2 CD_L3_INSTR Clock Domain Modes

Table 3-210 lists the clock domain modes supported by the clock domain.

Table 3-210. CD_L3_INSTR Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-211 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-211. CD_L3_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3INSTR_L3_GICLK Clock Status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3INSTR_L3_GICLK
L3INSTR_DLL_AGING_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[9] CLKACTIVITY_L3INSTR_DLL_AGING_GCLK
L3INSTR_TS_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[10] CLKACTIVITY_L3INSTR_TS_GCLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.15.3 CD_L3_INSTR Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

For aging, DLL requires a low-frequency clock that must run as long as the CORE power domain is on. To match this requirement, the DLL_AGING module has been created and instantiated in this clock domain, which is the last to transition in low-power state.

3.6.4.15.4 CD_L3_INSTR Clock Domain Module Attributes

Table 3-212 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-212. CD_L3_INSTR Modules Clocks Association

Module	Clock	Clock Type
L3_MAIN_2 interconnect	L3INSTR_L3_GICLK	Interface
	L3INSTR_L4_GICLK	Interface
L3_INSTR interconnect	L3INSTR_L3_GICLK	Interface
OCP_WP_NOC	L3INSTR_L3_GICLK	Interface
	L3INSTR_L4_GICLK	Interface
DLL_AGING	L3INSTR_DLL_AGING_GCLK	Interface
CTRL_MODULE_BANDGAP	L3INSTR_TS_GCLK	Interface

Table 3-213 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-213. CD_L3_INSTR Modules Wake-Up Request

Module	Wake-Up Feature
L3_MAIN_2 interconnect	None
L3_INSTR interconnect	None
OCP_WP_NOC	None
DLL_AGING	None
CTRL_MODULE_BANDGAP	None

Table 3-214 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-214. CD_L3_INSTR Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_MAIN_3 interconnect	Slave	CM_L3INSTR_L3_MAIN_2_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_MAIN_2_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
L3_INSTR interconnect	Slave	CM_L3INSTR_L3_INSTR_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
OCP_WP_NOC	Slave	CM_L3INSTR_OCP_WP_NOC_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_OCP_WP_NOC_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
DLL_AGING	Slave	CM_L3INSTR_DLL_AGING_CLKCTRL[17:16] IDLEST	Idle status
CTRL_MODULE_BANDGAP	Slave	CM_L3INSTR_CTRL_MODULE_BANDGAP_CLKCTRL[17:16] IDLEST	Idle status

Table 3-215 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-218. CD_L3_MAIN1 Dynamic Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_WKUPAON	Always enabled	CM_L3MAIN1_DYNAMICDEP[15] WKUPAON_DYNDEP	Read only

3.6.4.16.4 CD_L3_MAIN1 Clock Domain Module Attributes

Table 3-219 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-219. CD_L3_MAIN1 Modules Clocks Association

Module	Clock	Clock Type
L3_MAIN1 interconnect	L3MAIN1_L3_GICLK	Interface
	L3MAIN1_L4_GICLK	Interface
GPMC	L3MAIN1_L3_GICLK	Interface
OCMC_RAM1	L3MAIN1_L3_GICLK	Interface(1)
VCP1	L3MAIN1_L3_GICLK	Interface
VCP2	L3MAIN1_L3_GICLK	Interface
MMU_EDMA	L3MAIN1_L3_GICLK	Interface(1)
MMU_PCIESS	L3MAIN1_L3_GICLK	Interface(1)
EDMA_TPCC	L3MAIN1_L3_GICLK	Interface
EDMA_TC0	L3MAIN1_L3_GICLK	Interface
EDMA_TC1	L3MAIN1_L3_GICLK	Interface

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L3MAIN1_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-220 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-220. CD_L3_MAIN1 Modules Wake-Up Request

Module	Wake-Up Feature
L3_MAIN1 interconnect	None
GPMC	None
OCMC_RAM1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
VCP1	None
VCP2	None
MMU_EDMA	None
MMU_PCIESS	None
EDMA_TPCC	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)
EDMA_TC0	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request
EDMA_TC1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request

Table 3-221 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

3.6.4.17.3 CD_EMIF Clock Domain Dependency

CD_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.4.17.4 CD_EMIF Clock Domain Module Attributes

Table 3-225 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-225. CD_EMIF Modules Clocks Association

Module	Clock	Clock Type
DLL	EMIF_DLL_GCLK	Functional
DMM	EMIF_L3_GICLK	Interface
EMIF1	EMIF_L3_GICLK	Interface
	MA_EOCP_GICLK(1)	Interface
	L3_EOCP_GICLK(1)	Interface
	EMIF_PHY_GCLK	Interface
EMIF_OCP_FW	EMIF_L3_GICLK	Interface
	EMIF_L4_GICLK	Interface

(1) EMIF modules are clocked by MA_EOCP_GICLK when MPU is active; otherwise, the L3_EOCP_GICLK clock is used.

Table 3-226 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-226. CD_EMIF Modules Wake-Up Request

Module	Wake-Up Feature
DLL	None
DMM	None
EMIF1	None
EMIF_OCP_FW	None

Table 3-227 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-227. CD_EMIF Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DMM	Slave	CM_EMIF_DMM_CLKCTRL[17:16] IDLEST	Idle status

CD_PCIE	Enabled	CM_IPU1_STATICDEP[29] PCIE_STATDEP	Read/write
CD_ATL	Enabled	CM_IPU1_STATICDEP[30] ATL_STATDEP	Read/write

3.6.4.18.3.2 CD_IPU Dynamic Dependency

Table 3-232 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-232. CD_IPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_IPU1_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.18.4 CD_IPU Clock Domain Module Attributes

Table 3-233 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-233. CD_IPU Modules Clocks Association

Module	Clock	Clock Type
TIMER5	IPU_L3_GICLK	Interface(1)
	TIMER5_GFCLK	Functional
TIMER6	IPU_L3_GICLK	Interface(1)
	TIMER6_GFCLK	Functional
TIMER7	IPU_L3_GICLK	Interface(1)
	TIMER7_GFCLK	Functional
TIMER8	IPU_L3_GICLK	Interface(1)
	TIMER8_GFCLK	Functional
UART6	IPU_L3_GICLK	Interface(1)
	UART6_GFCLK	Functional
I2C5	IPU_L3_GICLK	Interface(1)
	IPU_96M_GFCLK	Functional
MCASP1	IPU_L3_GICLK	Interface(1)
	MCASP1_AHCLKR	Functional
	MCASP1_AHCLKX	Functional
	MCASP1_AUX_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the IPU_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-234 lists the supported wake-up request generation capability for each module of the clock domain.

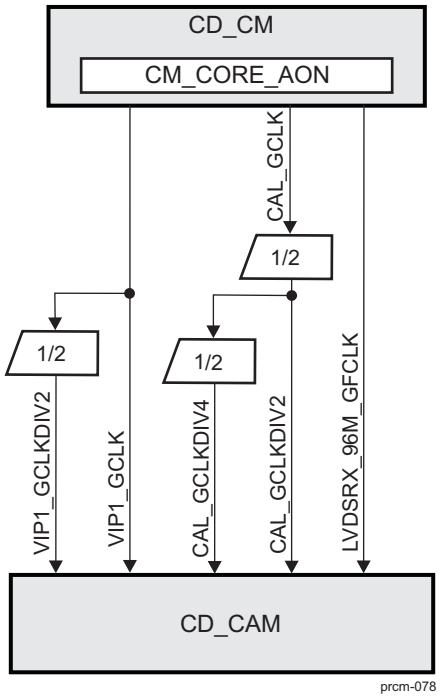
3.6.4.23 CD_CAM Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.23.1 CD_CAM Overview

Figure 3-80 is an overview of the clock domain.

Figure 3-80. CD_CAM Overview



3.6.4.23.2 CD_CAM Clock Domain Modes

Table 3-267 lists the clock domain modes supported by the clock domain.

Table 3-267. CD_CAM Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-268 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-268. CD_CAM Control and Status Parameters

Parameter Name	Control/Status Bit Field
VIP1_GCLK Clock Status	CM_CAM_CLKSTCTRL[8] CLKACTIVITY_VIP1_GCLK
CAL_GCLK Clock Status	CM_CAM_CLKSTCTRL[9] CLKACTIVITY_CAL_GCLK
LVDSRX_96M_GFCLK Clock Status	CM_CAM_CLKSTCTRL[12] CLKACTIVITY_LVDSRX_96M_GFCLK
Clock Domain State Transition Control	CM_CAM_CLKSTCTRL[1:0] CLKTRCTRL

Copyright © 2015–2019, Texas Instruments Incorporated

3.6.4.23.3 CD_CAM Clock Domain Dependency

CD_CAM has no module wake-up dependency with any other clock domain of the device.

3.6.4.23.3.1 CD_CAM Static Dependency

Table 3-269 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-269. CD_CAM Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_CAM_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Always enabled	CM_CAM_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_L4_CFG	Disabled	CM_CAM_STATICDEP[12] L4CFG_STATDEP	Read only
CD_EMIF	Always enabled	CM_CAM_STATICDEP[4] EMIF_STATDEP	Read/write
CD_GMAC	Disabled	CM_CAM_STATICDEP[25] GMAC_STATDEP	Read/write
CD_L4PER3	Disabled	CM_CAM_STATICDEP[27] L4PER3_STATDEP	Read/write
CD_VPE	Disabled	CM_CAM_STATICDEP[28] VPE_STATDEP	Read/write

3.6.4.23.3.2 CD_CAM Dynamic Dependency

CD_CAM has no dynamic dependency with any other clock domain of the device.

3.6.4.23.4 CD_CAM Clock Domain Module Attributes

Table 3-270 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-270. CD_CAM Modules Clocks Association

Module	Clock	Clock Type
VIP1	VIP1_GCLK	Functional
	VIP1_GCLKDIV2 (1)	Interface
CAL	CAL_GCLKDIV2 (2)	Functional
	CAL_GCLKDIV4 (3)	Interface
CSI2_PHY1	LVDSRX_96M_GFCLK	Interface and functional
CSI2_PHY2	LVDSRX_96M_GFCLK	Interface and functional

(1) VIP1_GCLKDIV2 is divided by 2 version of the VIP1_GCLK. For more information, see Section 9.3 *VIP Integration*

(2) CAL_GCLKDIV2 is divided by 2 version of the CAL_GCLK. For more information, see Section 8.3 *CAMSS Integration*

(3) CAL_GCLKDIV4 clock is obtained by additional division by 2 of the CAL_GCLKDIV2. For more information, see Section 8.3 *CAMSS Integration*

NOTE: Please note that CAL_GCLK is used as primary clock for CAL Controller logic and Initiator interface. This is obtained by dividing the CAL_GCLK clock by 2. CAL module internally generates a divided clock for its Slave interface and PHY configuration interface by using the clock enable signal. This Enable signal is obtained by further dividing by 2 of the CAL_GCLK. For more information about CAL module clocks, see Section 8.3 *CAMSS Integration* and Section 8.4.2 *CAMSS Clock Configuration* in Chapter 8 *Camera Interface Subsystem.*

Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: CSI2_PHY2 is not supported on the AM570x family of devices.

Table 3-271 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-271. CD_CAM Modules Wake-Up Request

Module	Wake-Up Feature
VIP1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request
CAL	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request
CSI2_PHY1, CSI2_PHY2	None

NOTE: The CAL module does not support Master Standby/Wakeup protocol. Only Slave Idle protocol is supported.

In order to use the CAL module the user needs to wakeup PD_CAM. Also since CAL module supports only Idle protocol, there is possibility of the PD_CAM to be in to OFF power state, if there is no activity of the CAL slave interface. Hence it is necessary to program Software Wakeup on PD_CAM to ensure that PD_CAM (and in turn CAL module) does not go to power off/ Reset state during the camera operation. The Idle protocol configuration of the CAL module can be programmed by the user to **No Idle** in the CAL_HL_SYSCONFIG[3:2] IDLEMODE register, so that CAL does not auto acknowledge any Idle request from the PRCM module.

Table 3-272 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-272. CD_CAM Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
VIP1	Master/slave	CM_CAM_VIP1_CLKCTRL[18] STBYST	Standby status
		CM_CAM_VIP1_CLKCTRL[17:16] IDLEST	Idle status
CAL	Master/slave	CM_CAM_CAL_CLKCTRL[18] STBYST(1)	Standby status
		CM_CAM_CAL_CLKCTRL[17:16] IDLEST	Idle status

(1) The CAL module does not support Master Standby/Wakeup protocol. Only Slave Idle protocol is supported.

Table 3-273 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-273. CD_CAM Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
VIP1	Available	Available	N/A	CM_CAM_VIP1_CLKCTRL[1:0] MODULEMODE	Read/write
CAL	Available	Available	N/A	CM_CAM_CAL_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.24.3 CD_GMAC Clock Domain Dependency

3.6.4.24.3.1 CD_GMAC Static Dependency

Table 3-276 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-276. CD_GMAC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_GMAC_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_GMAC_STATICDEP[4] EMIF_STATDEP	Read/write
CD_L4PER2	Disabled	CM_GMAC_STATICDEP[26] L4PER2_STATDEP	Read/write

3.6.4.24.3.2 CD_GMAC Dynamic Dependency

Table 3-277 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-277. CD_GMAC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always disabled	CM_GMAC_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.24.4 CD_GMAC Clock Domain Module Attributes

Table 3-278 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-278. CD_GMAC Modules Clocks Association“

Module	Clock	Clock Type
CPGMAC	GMAC_MAIN_CLK	Interface
	GMAC_RFT_CLK	Functional
	GMII_250MHZ_CLK	Functional
	RGMII_5MHZ_CLK	Functional
	RMII_50MHZ_CLK	Functional

Table 3-279 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-279. CD_GMAC Modules Wake-Up Request

Module	Wake-Up Feature
GMAC	None

Table 3-280 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-280. CD_GMAC Modules Clock-Management Modes and Control

	CD_PCIE	CD_DSP1, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_PCIE_PCIESS2_WKDEP[2] WKUPDEP_PCIESS2_DSP1	Read/write

3.6.4.27.4 CD_PCIE Clock Domain Module Attributes

Table 3-301 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-301. CD_PCIE Modules Clocks Association

Module	Clock	Clock Type
PCIe_SS1	PCIE_L3_GICLK	Interface
	PCIE_REF_GFCLK	Functional
	PCIE_32K_GFCLK	Functional
	PCIE_PHY_GCLK	Functional
	PCIE_PHY_DIV_GCLK	Functional
PCIe_SS2	PCIE_L3_GICLK	Interface
	PCIE_REF_GFCLK	Functional
	PCIE_32K_GFCLK	Functional
	PCIE_PHY_GCLK	Functional
	PCIE_PHY_DIV_GCLK	Functional

Table 3-302 lists the supported wake-up request generation capability for each module of the clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-302. CD_PCIE Modules Wake-Up Request

Module	Wake-Up Feature
PCIe_SS1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request
PCIe_SS2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ)/ Master wake-up request

Table 3-303 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-303. CD_PCIE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
PCIe_SS1	Master/Slave	CM_PCIE_PCIESS1_CLKCTRL[18] STBYST	Standby status
		CM_PCIE_PCIESS1_CLKCTRL[17:16] IDLEST	Idle status
		CM_PCIE_PCIESS1_CLKCTRL[10] OPTFCLKEN_PCIEPHY_CLK_DIV	PCIE PHY optional clock control
		CM_PCIE_PCIESS1_CLKCTRL[9] OPTFCLKEN_PCIEPHY_CLK	PCIE PHY optional clock control
		CM_PCIE_PCIESS1_CLKCTRL[8] OPTFCLKEN_32KHZ	PCIE PHY optional clock control
PCIe_SS2	Master/Slave	CM_PCIE_PCIESS2_CLKCTRL[18] STBYST	Standby status
		CM_PCIE_PCIESS2_CLKCTRL[17:16] IDLEST	Idle status
		CM_PCIE_PCIESS2_CLKCTRL[10] OPTFCLKEN_PCIEPHY_CLK_DIV	PCIE PHY optional clock control
		CM_PCIE_PCIESS2_CLKCTRL[9] OPTFCLKEN_PCIEPHY_CLK	PCIE PHY optional clock control
		CM_PCIE_PCIESS2_CLKCTRL[8] OPTFCLKEN_32KHZ	PCIE PHY optional clock control

NOTE: In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. Please note that setting CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE.

Table 3-304 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-304. CD_PCIE Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
PCIe_SS1	Available	N/A	Available	CM_PCIE_PCIESS1_CLKCTRL[1:0] MODULEMODE	Read/write
PCIe_SS2	Available	N/A	Available	CM_PCIE_PCIESS2_CLKCTRL[1:0] MODULEMODE	Read/write

3.7 Power Management Functional Description

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)
- FPKA
- DMA_CRYPTO

These modules are not supported on the AM570x family of devices only:

- SATA
- RTC

NOTE: Only the MPU Subsystem supports memory retention.

MPU subsystem does not support OFF state. Only CPU1 supports FORCED_OFF state with no subsequent recovery to ON/active state - this is very application specific and may not be available in all TI standard software offerings.

NOTE: In the L3INIT power domain OFF state is only allowed in systems where Ethernet RGMII is NOT used in the system - this is very application specific and may not be available in all TI standard software offerings.

This section describes the functional concepts of power management at the power domain level in the device.

The following power domains support dynamic power switching (DPS) with switching times of less than 5 µs.

- PD_CORE
- PD_MPU

3.7.1 PD_WKUPAON Description

PD_WKUPAON contains the following reset domains:

- WKUPAON_PWRON_RST
- WKUPAON_RST
- WKUPAON_SYS_PWRON_RST
- PRM_PWRON_RST
- PRM_RST
- LPRM_PWRON_RST
- LPRM_RST

PD_WKUPAON contains the CD_WKUPAON clock domain.

Table 3-305 lists the logic retention capability for each module of the power domain.

Table 3-305. PD_WKUPAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CTRL_MODULE_WKUP	No	None	None
GPIO1	No	RM_WKUPAON_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
KBD	No	RM_WKUPAON_KBD_CONTEXT[0] LOSTCONTEXT_DFF	None

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-305. PD_WKUPAON Modules Power Attributes (continued)

Module	Logic Retention	DFF Context Status	RFF Context Status
PRCM_MPU	No	None	None
COUNTER_32K	No	RM_WKUPAON_COUNTER_32K_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER1	No	RM_WKUPAON_TIMER1_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER12	No	RM_WKUPAON_TIMER12_CONTEXT[0] LOSTCONTEXT_DFF	None
WD_TIMER2	No	RM_WKUPAON_WD_TIMER2_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_WKUP interconnect	No	RM_WKUPAON_L4_WKUP_CONTEXT[0] LOSTCONTEXT_DFF	None
PRM	No	None	None
DCAN1	No	RM_WKUPAON_DCAN1_CONTEXT[0] LOSTCONTEXT_DFF	None
UART10	No	RM_WKUPAON_UART10_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.1.1 PD_WKUPAON Power Domain Modes

The PD_WKUPAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUPAON power domain has two memory banks(UART_MEM, DCAN_MEM) which are related to UART10 and DCAN1.

3.7.1.1.1 PD_WKUPAON Logic and Memory Area Power Modes

Table 3-306 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-306. PD_WKUPAON Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
WKUP_BANK		ON		
	UART10 - UART_MEM	always_on		
	DCAN1 - DCAN_MEM	always_on		

3.7.2 PD_DSP1 Description

PD_DSP1 contains the following reset domains:

- DSP1_RST
- DSP1_PWRON_RST
- DSP1_RET_RST
- DSP1_SYS_RST

PD_DSP1 contains the CD_DSP1 clock domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-307 lists the logic retention capability for each module of the power domain.

Table 3-307. PD_DSP1 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP1	No	RM_DSP1_DSP1_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.2.1 PD_DSP1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.2.1.1 PD_DSP1 Logic and Memory Area Power Modes

Table 3-308 lists the power modes supported by the logic area of the power domain.

Table 3-308. PD_DSP1 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-309 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-309. PD_DSP1 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
DSP1_EDMA		ON		OFF
	DSP – DSP_DMA	always_on		
DSP1_L1		ON		OFF
	DSP – DSP_L1	always_on		
DSP1_L2		ON		OFF
	DSP – DSP_L2	always_on		

3.7.2.1.2 PD_DSP1 Logic and Memory Area Power Modes Control and Status

Table 3-310 lists the power mode controls for the power domain.

Table 3-310. PD_DSP1 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_DSP1_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	DSP1_EDMA	PM_DSP1_PWRSTCTRL[21:20] DSP1_EDMA_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP1_L2	PM_DSP1_PWRSTCTRL[19:18] DSP1_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP1_L1	PM_DSP1_PWRSTCTRL[17:16] DSP1_L1_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSP1_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-311 lists the power mode status for the power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-311. PD_DSP1 Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_DSP1_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	DSP1_EDMA	PM_DSP1_PWRSTST[9:8] DSP1_EDMA_STATEST
Memory Area – State Status	DSP1_L2	PM_DSP1_PWRSTST[7:6] DSP1_L2_STATEST
Memory Area – State Status	DSP1_L1	PM_DSP1_PWRSTST[5:4] DSP1_L1_STATEST
Power Domain – State Transition Status		PM_DSP1_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSP1_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_DSP1_PWRSTST[1:0] POWERSTATEST

3.7.3 PD_CUSTEFUSE Description

PD_CUSTEFUSE contains the following reset domains:

- CUSTEFUSE_RST

PD_CUSTEFUSE contains the CD_CUSTEFUSE clock domain.

Table 3-307 lists the logic retention capability for each module of the power domain.

Table 3-312. PD_CUSTEFUSE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EFUSE_CTRL_CUST	No	RM_CUSTEFUSE_EFUSE_CTRL_CUST_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.3.1 PD_CUSTEFUSE Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.3.1.1 PD_CUSTEFUSE Logic and Memory Area Power Modes

Table 3-308 lists the power modes supported by the logic area of the power domain.

Table 3-313. PD_CUSTEFUSE Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

There is no memory bank implemented for the PD_CUSTEFUSE.

3.7.3.1.2 PD_CUSTEFUSE Logic and Memory Area Power Modes Control and Status

Table 3-310 lists the power mode controls for the power domain.

Table 3-314. PD_CUSTEFUSE Power Modes Control Parameters

Parameter Name	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control	PM_CUSTEFUSE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-314. PD_CUSTEFUSE Power Modes Control Parameters (continued)

Parameter Name	Control Bit Field	Access Type
Power Domain – State Transition Control	PM_CUSTEFUSE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-311 lists the power mode status for the power domain.

Table 3-315. PD_CUSTEFUSE Power Modes Status Parameters

Parameter Name	Status Bit Field
Power Domain – Last Power State Entered Status	PM_CUSTEFUSE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status	PM_CUSTEFUSE_PWRSTST[20] INTRANSITION
Logic Area – State Status	PM_CUSTEFUSE_PWRSTST[2] LOGICSTATEST
Power Domain – State Status	PM_CUSTEFUSE_PWRSTST[1:0] POWERSTATEST

3.7.4 PD_MPU Description

PD_MPU contains the following reset domains:

- MPU_PWRON_RST
- MPU_RST
- MPU_MA_RST
- MPU_MA_RET_RST
- MPU_MA_PWRON_RET_RST

PD_MPU contains the CD_MPU clock domain.

Table 3-316 lists the logic retention capability for each module of the power domain.

Table 3-316. PD_MPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
MPU	Partial	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	RM_MPU_MPU_CONTEXT[1] LOSTCONTEXT_RFF

3.7.4.1 PD_MPU Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.4.1.1 PD_MPU Logic and Memory Area Power Modes

Table 3-317 lists the power modes supported by the logic area of the power domain.

Table 3-317. PD_MPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-318 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-318. PD_MPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
MPU_L2		ON	OFF or RETENTION	
	MPU – MPU_L2	always_on	always_retention	
MPU_RAM		ON	RETENTION	
	MPU - MPU_RAM	always_on	always_retention	

3.7.4.1.2 PD_MPU Logic and Memory Area Power Modes Control and Status

Table 3-319 lists the power mode controls for the power domain.

Table 3-319. PD_MPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	MPU_RAM	PM_MPU_PWRSTCTRL[10] MPU_RAM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_MPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read only
Logic Area – Retention State Control		PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	MPU_L2	PM_MPU_PWRSTCTRL[19:18] MPU_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	MPU_RAM	PM_MPU_PWRSTCTRL[21:20] MPU_RAM_ONSTATE	Read only
Power Domain – State Transition Control		PM_MPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-320 lists the status of the power modes for the power domain.

Table 3-320. PD_MPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area – State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Power Domain – State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

3.7.4.1.3 PD_MPU Power State Override

The PRCM module controls the power state of the MPU subsystem, whereas the PRCM_MPU controls the power state of each CPU (CPU0 and CPU1). The MPU subsystem requires that the MPU power domain can transition only to a low-power mode when CPU0 and CPU1 are in a lower power mode than is specified in the PM_MPU_PWRSTCTRL register. The power mode of the CPUs is communicated to the PRCM module by the PRCM_MPU through two dedicated internal signals. These two signals specify the lowest power state that the MPU can enter and, if necessary, override the low-power state programmed in the PM_MPU_PWRSTCTRL register.

Table 3-321 lists the low-power modes allowed by the MPU.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-321. MPU Allowed Low-Power Mode

MPU Allowed Low-Power Mode	Comment
CSWRET	CPUs are in SR3-APG mode and L1$ is in RETENTION state.
INACTIVE	CPUs are in SR3-APG mode and L1$ is in ON state, or CPUs are in INACTIVE state.
ON	CPUs are in ON state.

If PM_MPU_PWRSTCTRL is programmed to a lower power state than allowed (specified by the two signals), then it is overwritten by the hardware. The valued of the PM_MPU_PWRSTCTRL register is not changed (that is, not overwritten).

3.7.5 PD_IPU Description

PD_IPU contains the following reset domains:

- IPU1_PWRON_RST
- IPU1_RST
- IPU1_RET_RST
- IPU_RST
- IPU_RET_RST
- IPU1_CPU0_RST
- IPU1_CPU1_RST

PD_IPU contains the CD_IPU1 clock domain.

Table 3-322 lists the logic retention capability for each module of the power domain.

Table 3-322. PD_IPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IPU1	Partial	RM_IPU1_IPU1_CONTEXT[0] LOSTCONTEXT_DFF	RM_IPU1_IPU1_CONTEXT[1] LOSTCONTEXT_RFF

3.7.5.1 PD_IPU Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.5.1.1 PD_IPU Logic and Memory Area Power Modes

Table 3-323 lists the power modes supported by the logic area of the power domain.

Table 3-323. PD_IPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-324 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-324. PD_IPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
AESSMEM		ON	RETENTION	OFF
	IPU1 – IPU_L2RAM_MEM	always_on	software_control	
PERIPHMEM		ON		OFF
	IPU1 - IPU_UNICACHE_MEM	always_on	always_retention	

3.7.5.1.2 PD_IPU Logic and Memory Area Power Modes Control and Status

Table 3-325 lists the power mode controls for the power domain.

Table 3-325. PD_IPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	AESSMEM	PM_IPU_PWRSTCTRL[8] AESSMEM_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	PERIPHMEM	PM_IPU_PWRSTCTRL[10] PERIPHMEM_RETSTATE	Read/write
Power Domain – Low-Power State Change Control		PM_IPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – Retention State Control		PM_IPU_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	AESSMEM	PM_IPU_PWRSTCTRL[17:16] AESSMEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	PERIPHMEM	PM_IPU_PWRSTCTRL[21:20] PERIPHMEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_IPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-326 lists the status of the power modes for the power domain.

Table 3-326. PD_IPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_IPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	AESSMEM	PM_IPU_PWRSTST[5:4] AESSMEM_STATEST
Memory Area – State Status	PERIPHMEM	PM_IPU_PWRSTST[9:8] PERIPHMEM_STATEST
Power Domain – State Transition Status		PM_IPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_IPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_IPU_PWRSTST[1:0] POWERSTATEST

3.7.6 PD_L3INIT Description

PD_L3INIT contains the following reset domains:

- L3INIT_PWRON_RST
- L3INIT_RET_RST
- L3INIT_RST

PD_L3INIT contains the CD_L3INIT clock domain.

Table 3-327 lists the logic retention capability for each module of the power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-327. PD_L3INIT Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
USB1	Full	None	RM_L3INIT_USB_OTG_SS1_CONTEXT[1] LOSTCONTEXT_RFF
USB2	Full	None	RM_L3INIT_USB_OTG_SS2_CONTEXT[1] LOSTCONTEXT_RFF
USB3	Full	None	RM_L3INIT_USB_OTG_SS3_CONTEXT[1] LOSTCONTEXT_RFF
SATA(1)	No	RM_L3INIT_SATA_CONTEXT[0] LOSTCONTEXT_DFF	None
PCIe_SS1	No	RM_PCIE_PCIESS1_CONTEXT[0] LOSTCONTEXT_DFF	None
PCIe_SS2	No	RM_PCIE_PCIESS2_CONTEXT[0] LOSTCONTEXT_DFF	None

(1) SATA is not supported on the AM570x family of devices.

3.7.6.1 PD_L3INIT Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.6.1.1 PD_L3INIT Logic and Memory Area Power Modes

Table 3-328 lists the power modes supported by the logic area of the power domain.

Table 3-328. PD_L3INIT Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available

Table 3-329 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-329. PD_L3INIT Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
L3INIT_BANK1		ON		OFF
	PCIe_SS1 – PCIE_MEM	always_on	always_off	
	PCIe_SS2 – PCIE_MEM	always_on	always_off	
	SATA – sata_bank	always_on	always_off	
L3INIT_BANK2		ON	RETENTION	OFF
	USB_OTG_SS1 – USB_MEM	always_on	always_retention	
	USB_OTG_SS2– USB_MEM	always_on	always_retention	
	USB_OTG_SS3 – USB_MEM	always_on	always_retention	

3.7.6.1.2 PD_L3INIT Logic and Memory Area Power Modes Control and Status

Table 3-330 lists the power modes controls for the power domain.

Table 3-330. PD_L3INIT Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[8] L3INIT_BANK1_RETSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	L3INIT_BANK2	PM_L3INIT_PWRSTCTRL[9] L3INIT_BANK2_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_L3INIT_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_L3INIT_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[15:14] L3INIT_BANK1_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	L3INIT_BANK2	PM_L3INIT_PWRSTCTRL[17:16] L3INIT_BANK2_ONSTATE	Read only
Power Domain – State Transition Control		PM_L3INIT_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-331 lists the status of the power modes for the power domain.

Table 3-331. PD_L3INIT Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_L3INIT_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	L3INIT_BANK1	PM_L3INIT_PWRSTST[5:4] L3INIT_BANK1_STATEST
Memory Area – State Status	L3INIT_BANK2	PM_L3INIT_PWRSTST[7:6] L3INIT_BANK2_STATEST
Power Domain – State Transition Status		PM_L3INIT_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_L3INIT_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_L3INIT_PWRSTST[1:0] POWERSTATEST

3.7.7 PD_L4PER Description

PD_L4PER contains the following reset domains:

- L4PER_PWRON_RET_RST
- L4PER_RET_RST
- L4PER_RST
- PRUSS1_RST
- PRUSS2_RST

PD_L4PER has no associated clock domains.

3.7.8 PD_IVA Description

PD_IVA contains the following reset domains:

- IVA_PWRON_RST
- IVA_RST
- IVA_SEQ1_RST
- IVA_SEQ2_RST

PD_IVA contains the CD_IVA clock domain.

Table 3-332 lists the logic retention capability for each module of the power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-332. PD_IVA Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IVA	No	RM_IVA_IVA_CONTEXT[0] LOSTCONTEXT_DFF	None
SL2	No	RM_IVA_SL2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.8.1 PD_IVA Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.8.1.1 PD_IVA Logic and Memory Area Power Modes

Table 3-333 lists the power modes supported by the logic area of the power domain.

Table 3-333. PD_IVA Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-334 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

3.7.9.1.1 PD_GPU Logic and Memory Area Power Modes

Table 3-338 lists the power modes supported by the logic area of the power domain.

Table 3-338. PD_GPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-339 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-339. PD_GPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic off
GPU_MEM		ON		OFF
	GPU – GPU_MEM	always_on	always_off	

3.7.9.1.2 PD_GPU Logic and Memory Area Power Modes Control and Status

Table 3-340 lists the power mode controls for the power domain.

Table 3-340. PD_GPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_GPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	GPU_MEM	PM_GPU_PWRSTCTRL[17:16] GPU_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_GPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-341 lists the status of the power modes for the power domain.

Table 3-341. PD_GPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	GPU_MEM	PM_GPU_PWRSTST[5:4] GPU_MEM_STATEST
Power Domain – Last Power State Entered Status		PM_GPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_GPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_GPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_GPU_PWRSTST[1:0] POWERSTATEST

3.7.10 PD_EMU Description

PD_EMU contains the following reset domains:

- EMU_EARLY_PWRON_RST
- EMU_PWRON_RST
- EMU_RST

PD_EMU has no associated clock domains.

Copyright © 2015–2019, Texas Instruments Incorporated

3.7.11 PD_DSS Description

PD_DSS contains the following reset domains:

- DSS_RET_RST
- DSS_RST

PD_DSS contains the CD_DSS clock domain.

Table 3-342 lists the logic retention capability for each module of the power domain.

Table 3-342. PD_DSS Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSS	Partial	RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF
BB2D	None	RM_DSS_BB2D_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.11.1 PD_DSS Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.11.1.1 PD_DSS Logic and Memory Area Power Modes

Table 3-343 lists the power modes supported by the logic area of the power domain.

Table 3-343. PD_DSS Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Available	Not available	Available

Table 3-344 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-344. PD_DSS Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
DSS_MEM		ON		OFF
	DSS – DSSMEM	always_on	always_off	
	BB2D - BB2D_MEM	always_on	always_off	

3.7.11.1.2 PD_DSS Logic and Memory Area Power Mode Control and Status

Table 3-345 lists the power modes controls for the power domain.

Table 3-345. PD_DSS Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read only

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-345. PD_DSS Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in ON state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-346 lists the status of the power modes for the power domain.

Table 3-346. PD_DSS Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain – Last Low Power State Entered Status		PM_DSS_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain – Current Power State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

3.7.12 PD_CORE Description

PD_CORE contains the following reset domains:

- CM_CORE_PWRON_RET_RST
- CM_CORE_RET_RST
- CORE_PWRON_RET_RST
- CORE_PWRON_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- IPU2_PWRON_RST
- IPU2_RET_RST
- IPU2_CPU0_RST
- IPU2_CPU1_RST
- IPU2_RST
- DMA_RET_RST

PD_CORE contains the following clock domains:

- CD_IPU2

Table 3-347 lists the logic retention capability for each module of the power domain.

Table 3-347. PD_CORE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CM_CORE	Full	None	None
IPU2	Partial	RM_IPU2_IPU2_CONTEXT[0] LOSTCONTEXT_DFF	RM_IPU2_IPU2_CONTEXT[1] LOSTCONTEXT_RFF

3.7.12.1 PD_CORE Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.12.1.1 PD_CORE Logic and Memory Area Power Modes

Table 3-348 lists the power modes supported by the logic area of the power domain.

Table 3-348. PD_CORE Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-349 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-349. PD_CORE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
IPU_L2RAM		ON	RETENTION	
	IPU2 – IPU_L2RAM_MEM	always_on	software_control	
IPU_UNICACHE		ON	RETENTION	
	IPU2 – IPU_UNICACHE_mem	always_on	software_control	

3.7.12.1.2 PD_CORE Logic and Memory Area Power Mode Control and Status

Table 3-350 lists the power mode controls for the power domain.

Table 3-350. PD_CORE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in ON state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[23:22] IPU_UNICACHE_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[21:20] IPU_L2RAM_ONSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[11] IPU_UNICACHE_RETSTATE	Read/write
Memory Area – State Control (Logic in RETENTION state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[10] IPU_L2RAM_RETSTATE	Read/write
Logic Area – RETENTION State Control	N/A	PM_CORE_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Power Domain – Low-Power State Change Control	N/A	PM_CORE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	N/A	PM_CORE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-351 lists the status of the power modes for the power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-351. PD_CORE Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_CORE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	IPU_L2RAM	PM_CORE_PWRSTST[9:8] IPU_L2RAM_STATEST
Memory Area – State Status	IPU_UNICACHE	PM_CORE_PWRSTST[11:10] IPU_UNICACHE_STATEST
Logic Area – State Status		PM_CORE_PWRSTST[2] LOGICSTATEST
Power Domain – State Transition Status		PM_CORE_PWRSTST[20] INTRANSITION
Power Domain – State Status		PM_CORE_PWRSTST[1:0] POWERSTATEST

3.7.13 PD_CAM Description

PD_CAM contains the CAM_RST reset domain.

PD_CAM contains the CD_CAM clock domain.

Table 3-352 lists the logic retention capability for each module of the power domain.

Table 3-352. PD_CAM Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
VIP1	No	RM_CAM_VIP1_CONTEXT[0] LOSTCONTEXT_DFF	None
CAL	No	RM_CAM_CAL_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.13.1 PD_CAM Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.13.1.1 PD_CAM Logic and Memory Area Power Modes

Table 3-353 lists the power modes supported by the logic area of the power domain.

Table 3-353. PD_CAM Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-354 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-354. PD_CAM Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
VIP_BANK		ON		OFF
	VIP1 – VIP_MEM	always_on	always_retention	
	CAL – VIP_MEM	always_on	always_retention

3.7.13.1.2 PD_CAM Logic and Memory Area Power Mode Control and Status

Table 3-355 lists the power mode controls for the power domain.

Table 3-355. PD_CAM Power Mode Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_CAM_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (Logic in ON state)	VIP_BANK	PM_CAM_PWRSTCTRL[17:16] VIP_BANK_ONSTATE	Read only
Power Domain – State Transition Control		PM_CAM_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-356 lists the status of the power modes for the power domain.

Table 3-356. PD_CAM Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	VIP_BANK	PM_CAM_PWRSTST[5:4] VIP_BANK_STATEST
Power Domain – Last Power State Entered Status		PM_CAM_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_CAM_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_CAM_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_CAM_PWRSTST[1:0] POWERSTATEST

3.7.14 PD_MPUAON Description

PD_MPUAON contains the following reset domains:

- MPUON_RST
- DPLL_MPU_PWRON_RST

PD_MPUAON has no associated clock domains.

Table 3-357 lists the logic retention capability for each module of the power domain.

Table 3-357. PD_MPUAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None
INTC_MPU	No	None	None

3.7.14.1 PD_MPUAON Power Domain Modes

The PD_MPUAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MPUAON power domain has no memory banks.

3.7.15 PD_MMAON Description

PD_MMAON contains the following reset domains:

- MMAON_RST
- DPLL_DSP_PWRON_RST

PD_MMAON has no associated clock domains.

Table 3-358 lists the logic retention capability for each module of the power domain.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-358. PD_MMAON Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP SYS Wakeup Logic	No	None	None

3.7.15.1 PD_MMAON Power Domain Modes

The PD_MMAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MMAON power domain has no memory banks.

3.7.16 PD_COREAON Description

PD_COREAON contains the following reset domains:

- CM_CORE_AON_PWRON_RST
- CM_CORE_AON_RST
- COREAON_PWRON_RST
- COREAON_RST
- DPLL_IVA_PWRON_RST

PD_COREAON contains the following clock domains: CD_COREAON_L4, CD_IPU, CD_EMU, CD_L4_PER1, CD_L4_PER2, CD_L4_PER3, CD_L4SEC, CD_L4_CFG, CD_EMIF, CD_L3_MAIN1, CD_ATL, CD_DMA, CD_L3_INSTR, CD_GMAC clock domains.

Table 3-359 lists the logic retention capability for each module of the power domain.

3.8 Voltage-Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see Section 3.1.1.3, *Voltage Management*). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_IVAHD_L
- VDD_DSPEVE_L
- VDD_GPU_L
- VDD_RTC_L

NOTE: For the association of the device power supply pin to the power domain, see Table 3-26.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L, VDD_IVAHD_L, VDD_DSPEVE_L, VDD_GPU_L and VDD_RTC_L voltage domains.

The PRCM module also supports the ABB technique on the MPU, IVAHD, DSPEVE and GPU voltage domains through the VDD_MPU_ABB, VDD_IVA_ABB, VDD_DSPEVE_ABB and VDD_GPU_ABB biasing voltages.

At boot time, the device is set with all five voltage domains (VDD_MPU_L, VDD_GPU_L, VDD_CORE_L, VDD_DSPEVE_L, VDD_IVAHD_L) at OPP_NOM.

3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- A device PRCM for managing the I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management, and WAKEUP logic.
- BANDGAPs reference voltage sleep control

Figure 3-85 shows the architecture for PRM voltage control. This figure represents an example in which the I^2C interface is used to control the PMIC.

3.8.3 Internal LDOs Control

3.8.3.1 VDD_MPU_L, VDD_CORE_L, and VDD_IVAHD_L, VDD_GPU_L, VDD_DSPEVE_L Control

3.8.3.1.1 Adaptive Voltage Scaling

As explained in Section 3.1.2.4, *Adaptive Voltage Scaling* with the SmartReflex technology the power supply voltage can be adapted to the silicon performance statically (for example, adapted to the manufacturing process of a given device).

3.8.3.1.1.1 SmartReflex in the Device

Figure 3-86 shows the SmartReflex integration.

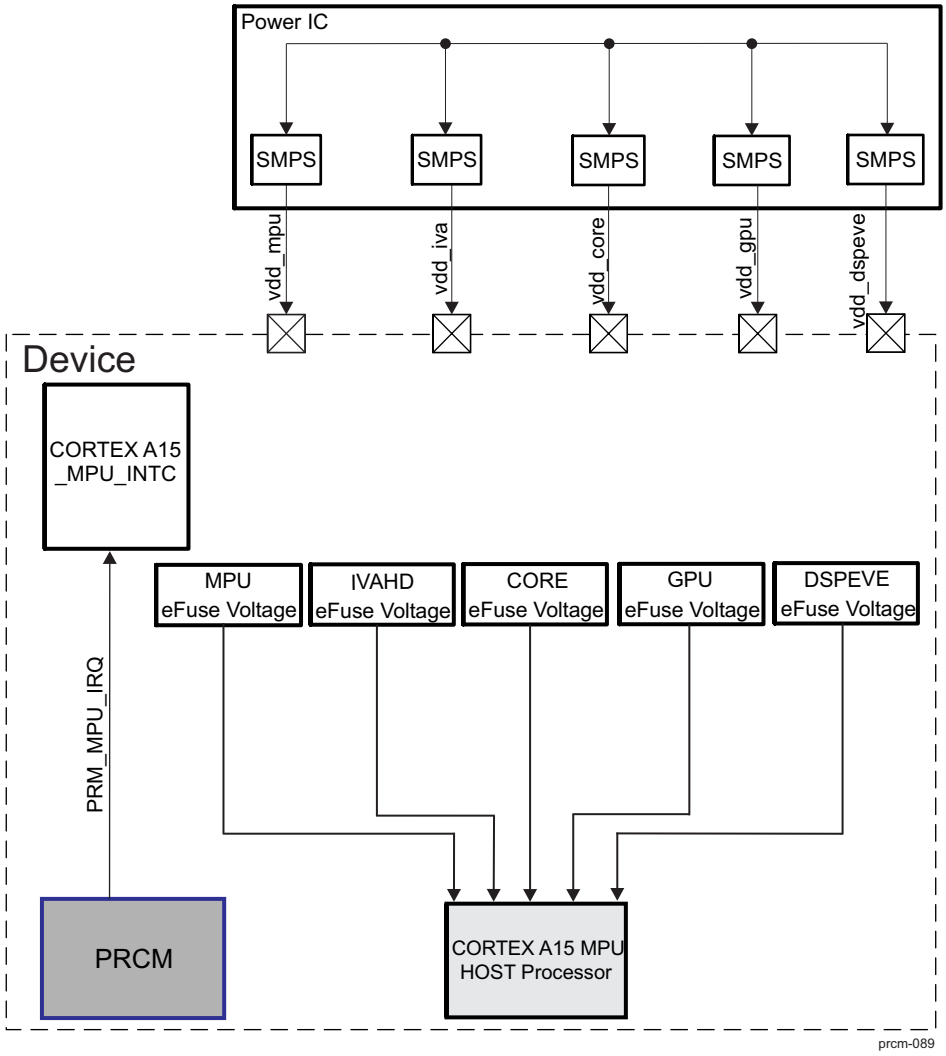
Figure 3-86. SmartReflex Integration



3.8.3.2 Memory LDOs

Embedded SRAM LDOs are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic, which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage never to be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on and retention mode:

- On (active) mode: 1.15 V is the normal voltage reference used through all functional OPPs whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE, or IVAHD) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in tracking mode and follows its respective VDD_x_M or VDD_x_ABB voltage level.
- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION state. In this mode, the output voltage is generated from the corresponding VDD_WKUP_L logic voltage source.

Section 3.8.3.6, *Memory LDOs Transitions*, describes the state transition conditions and sequences for the memory LDOs.

Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.3.3 ABB LDOs Control

The ABBLDO supports three voltage modes:

- Bypass mode: In this mode, the ABBLDO_x is bypassed and outputs the VDD_x_L voltages (x refers to the MPU and IVA). This mode is activated when FBB is not required, or when the voltage domain enters low-power mode.
- FBB mode is enabled when the device is a weak process device at the highest OPP.

The PRCM module provides the PRM_ABBLDO_MPU_SETUP and PRM_ABBLDO_GPU_SETUP registers for configuration with the following controls:

- SR2EN: To enable or bypass the ABB power management
- ACTIVE_FBB_SEL: To enable or bypass FBB mode
- SR2_WTCNT_VALUE: LDO settling delay on OPP change. The delay is in the number of system clock cycles.

The PRCM module provides the PRM_ABBLDO_MPU_CTRL and PRM_ABBLDO_GPU_CTRL registers for control:

- OPP_SEL: Current operational OPP
- OPP_CHANGE: Initiate an OPP-based ABBLDO setting change
- SR2_STATUS: Current mode of operation of ABBLDO
- SR2_IN_TRANSITION: ABBLDO in transition

3.8.3.4 ABB LDO Programming Sequence

Anytime the user enters or leaves one of the ABB-required OPPs, the appropriate procedure must be followed to enable or disable the ABB LDO.

3.8.3.4.1 ABB LDO Enable Sequence

The following steps turn on the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
   - The PRM_IRQSTATUS_MPU[x] ABB<Voltage_Domain_Name>_DONE_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass or FBB) is selected for the OPP (single write), configure the ABB transition:
   - To enter in Forward Body Bias (FBB) mode, set the PRM_ABBLDO_<Voltage_Domain_Name>_SETUP[2] ACTIVE_FBB_SEL bit to 0x1.
3. The user should set the PRM_ABBLDO_<Voltage_Domain_Name>_CTRL[2] OPP_ CHANGE bit to 0x0.
4. PRM_ABBLDO_MPU_CTRL[1:0] OPP_SEL bits should be set to 0x1, which select ‘Fast’ or Forward Body Bias mode.
5. The user should set the ABB voltage value in CTRL_<CORE|WKUP>_LDOVBB_<Voltage_ Domain_Name>_VOLTAGE_CTRL[4:0] LDOVBB<Voltage_Domain_Name>_FBB_VSET_ OUT.
   - To use the override value, set the CTRL_<CORE|WKUP>_LDOVBB_<Voltage_ Domain_Name>_VOLTAGE_CTRL[10]LDOVBB<Voltage_Domain_Name>_FBB_MUX_ CTRL bit to 0x1.
6. To enable the ABB LDO OPP change, set the PRM_ABBLDO_<Voltage_ Domain_Name>_CTRL[2] OPP_CHANGE bit to 0x1.
   - Wait until the transaction is complete: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ST bit should be set to 0x1.

Copyright © 2015–2019, Texas Instruments Incorporated

- Clear interrupt status: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_ DONE_ ST bit should be set to 0x0.

3.8.3.4.2 ABB LDO Disable Sequence (Entering in Bypass Mode)

The following steps turn off the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
   - The PRM_IRQSTATUS_MPU[x] ABB<Voltage_Domain_Name>_DONE_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass) is selected for the OPP (single write), configure the ABB transition:
   - To enter in Nominal (Bypass) mode, set the PRM_ABBLDO_<Voltage _Domain_Name>_SETUP[2] ACTIVE_FBB_SEL bit to 0x0.
3. The user should set the PRM_ABBLDO_<Voltage_Domain_Name>_CTRL[2] OPP_ CHANGE bit to 0x0.
4. PRM_ABBLDO_MPU_CTRL[1:0] OPP_SEL bits should be set to 0x0, which select Bypass mode.
5. To enable the ABB LDO OPP change, set the PRM_ABBLDO_<Voltage_ Domain_Name>_CTRL[2] OPP_CHANGE bit to 0x1.
   - Wait until the transaction is complete: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ST bit should be set to 0x1.
   - Clear the interrupt status: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ ST bit should be set to 0x1.
6. The user should set ABB voltage value in CTRL_<CORE|WKUP>_LDOVBB_<Voltage _Domain_Name>_VOLTAGE_CTRL[4:0] LDOVBB<Voltage_Domain_Name>_VSET_OUT to 0x0.

To use the eFuse voltage value, set the CTRL_<CORE|WKUP>_LDOVBB _<Voltage_Domain_Name>_VOLTAGE_CTRL[10] LDOVBB<Voltage_Domain_Name>_FBB_MUX_ CTRL bit to 0x0.

3.8.3.5 BANDGAPs Control

BANDGAPs provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the BANDGAPs, based on the power state of the device. It is completely transparent to user software.

BANDGAPs startup time is 100 µs. The PRM_BANDGAP_SETUP[7:0] STARTUP_COUNT bit field must be set accordingly.

3.8.3.6 Memory LDO Transitions

The transition trigger condition for on-to-retention mode is:

- At least all memory banks associated with the LDO are in RETENTION state.

The transition sequence is:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to:
   - Retention mode value if on-to-retention mode transition
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition is complete.

3.8.3.7 VDD_WKUP_L Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).

Copyright © 2015–2019, Texas Instruments Incorporated

- Clock states: Only the 32K clock is active in CD_WKUPAON.

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: device is in active mode.
- Clock states: any clock other than 32K clock is active in PD_WKUPAON.

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).
- Clock states: Only the 32K clock is active in CD_WKUPAON.

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

The transition sequence is:

1. Transition trigger conditions are met.
2. VDD_WKUP_L initiates the transition.
3. Starts a counter for VDD_WKUP_L transition.
4. VDD_WKUP_L transition completes.

3.8.4 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_IVAHD_L, VDD_DSPEVE_L and VDD_GPU_L), independently of one another. Upon a current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase in performance, the voltage is first raised, and then the frequency is increased. For a decrease in performance, the frequency is first decreased, and then the voltage is dropped.

Copyright © 2015–2019, Texas Instruments Incorporated

3.9 Device Low-Power States

NOTE: Device RTC low-power mode (only RTC active in the device) is not supported on the AM571x family of devices.

NOTE: RTC mode is not supported in this family of devices.RTC module is not supported on the AM570x family of devices.

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

These device low-power states are characterized by the system power consumption, wake-up latency, and required functionality.

The low-power states are:

- "**RTC mode**" : All logic voltage domains (VD_CORE, VD_MPU, VD_GPU, VD_IVAHD, VD_DSPEVE) are into OFF state except for the VD_RTC domain which is ON.

  NOTE: The VD_RTC remains always ON regardless of the low power state. RTC_SS is the only wake-up event source in the lowest power mode - RTC mode.

- "**STANDBY**" : Any combination of logic voltage domain states (SLEEP or RETENTION) other than ACTIVE state.

For more details on the wakeup-sources from the "RTC mode" and the "STANDBY" low-power modes, refer to the Table 3-367.

Once the PRCM module hardware detects any valid combination of power domain states, and if a proper programming model of the PRCM module is set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require an active clock.

The *Modules Attributes* subsection of each clock domain in Section 3.6, *Clock Management Functional Description*, describes the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

Table 3-367 identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

NOTE: These modules are not supported on this familyAM571x and AM570x families of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)

These modules are not supported on the AM570x family of devices only:

- SATA
- RTC

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-367. Wake-Up Sources During Device Low Power Mode

Device Power Mode name	VD_RTC VOLTAGE STATE	VD_CORE VOLTAGE STATE	VD_MPU VOLTAGE [1]STATE	VD_GPU [1]VOLTAGE STATE	VD_IVAHD VOLTAGE STATE	VD_DSPEVE VOLTAGE STATE	Domain containing wake-up source	Wakeup sources
Really OFF	OFF	OFF	OFF	OFF	OFF	OFF	N/A	Application of Power Supply and Power on Reset Sequence
RTC mode	ON	OFF	OFF	OFF	OFF	OFF	RTC SS sends signal to power supply to apply power voltage to all other voltage domains	RTC ("alarm" and "timer" slave wake-up capabilities), EXT_WKUP0, EXT_WKUP3
STANDBY	Active Voltage Level						PD_IPU [2]	I2C5, IPU1, MCASP1, TIMER5, TIMER6, TIMER7, TIMER8, UART6
							PD_CORE	DMA_SYSTEM, IPU2, OCMC_RAM1, EDMA_TPCC, EDMA_TPTC1, EDMA_TPTC2
							PD_L3INIT [2]	IEEE1500_2_OCP, MLB_SS, MMC1, MMC2, PCIe_SS1, PCIe_SS2, SATA, USB1, USB2, USB3
							PD_L4PER	DCAN2, GPIO2 - GPIO8, I2C1- I2C4, MCASP2 - MCASP8, MCSPI1 - MCSPI4, MMC3, MMC4, QSPI, TIMER2 - TIMER4, TIMER9 - TIMER11, TIMER13 - TIMER16, UART1 - UART9
							PD_MPU	MPU
							PD_DSP1	DSP1
							PD_WKUPAON	DCAN1, GPIO1, KBD, TIMER1, TIMER12, UART10, WD_TIMER2
							PD_EMU	(Debug_logic) Any ForceActive directive Dynanic depedency towards L3_MAIN

(1) VD_MPU and VD_GPU are not supported on the AM570x family of devices (merged with VD_CORE).

(2) Only modules able to generate asynchronous wake-up have to be taken into account, and only when domain is in INACT or CSWRET state.

Copyright © 2015–2019, Texas Instruments Incorporated

3.9.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence is modified as follows:

- The PRCM module releases its reset line. In parallel, the device reset manager counts for global reset extension (set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field). The PRCM module holds the other asserted resets until the global reset counter overflows.

The hardware blocks and modifies the CM_SHADOW_FREQ_CONFIG1[0] FREQ_UPDATE and CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL bit fields.

3.9.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes the voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in Section 3.9.2, *Wakeup Upon Global Warm Reset*, is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during phase 1 of automatic restore):

1. Global warm reset is delayed and applied after phase 1 restore completes.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

1. Global warm reset is applied immediately.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

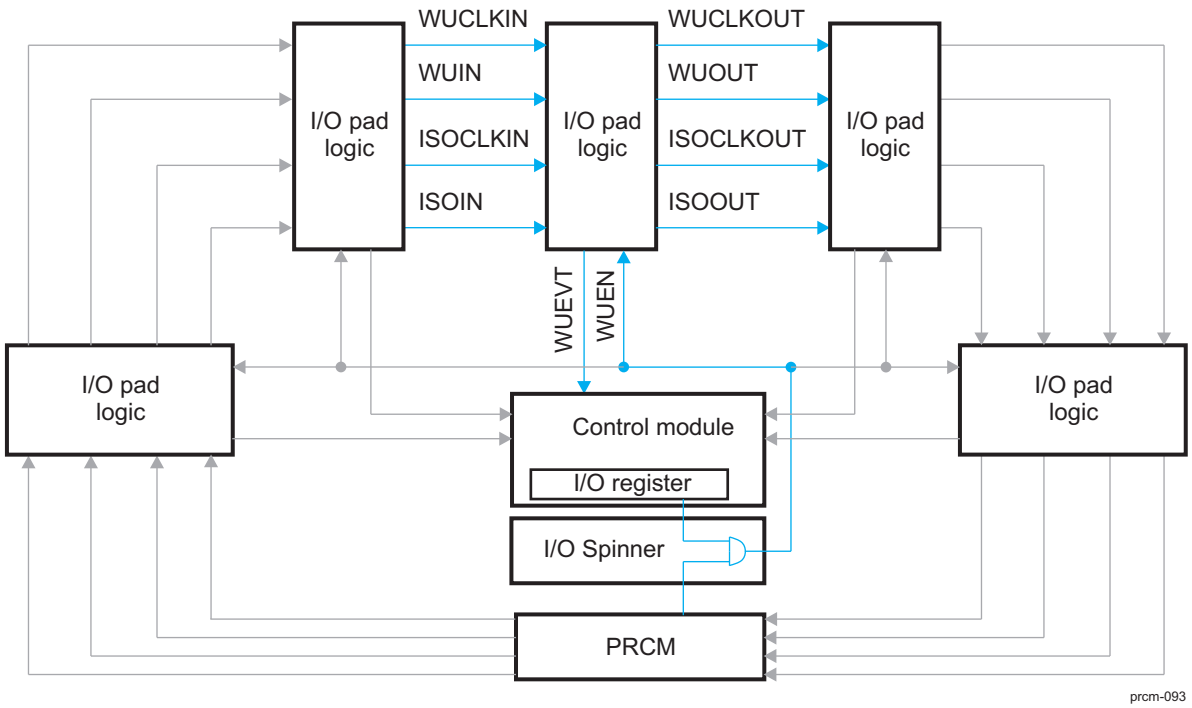
3.9.4 I/O Management

Figure 3-87 is an overview of the power-management modules and their internal connections with a generic power domain.

ISOIN, ISOCLKIN, WUCLKIN, WUIN, ISOOUT, ISOCLKOUT, WUCLKOUT and WUOUT connections are built with daisy chaining approach and are all VDD_WKUP_L level signals driven by PRM. WUEN and WUEVNT are VDD level signals driven by the control module and/or IO control module. ISOOVR and ISOBYPASS (for DDR IO only) are VDD level signals driven by the PRM.

Copyright © 2015–2019, Texas Instruments Incorporated

Figure 3-87. I/O Pads Daisy-Chain Configuration



NOTE: ISOBYPASS control from PRM is routed to all the EMIF i/f IOs and ISOOVR control from PRM is routed to all the remaining IOs. These control signals are routed using ALWON VDD buffers. The ISOOVR pin on EMIF IOs is tied to 0 using ALWON tie-off cells. PRM also provides an output status "IO_ISO_ACTIVE" which is set when EMIF IOs are isolated or transitioning between isolation and functional mode, and which is cleared when EMIF IOs are functional.

it is required that the ISOCLKIN is forced to 1 during global power-on reset (PRM_PWRON_RST_n = 0).

3.9.4.1 Isolation / Wakeup Sequence

Enabling Wake-Up Feature:

- Program Control module MMR to assert "WKEN" for each IO (To enable Wakeup feature of IO)
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 1 to assert high the signal WUCLKIN.
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 0 to assert low the signal WUCLKIN.
- This will latch WKEN, Latch the current pad input value.
- The PRCM register PRM_IO_PMCTRL[9] WUCLK_STATUS logs the signal WUCLK of the last pad of the IO ring.(Should be 0).

Device goes into sleep mode (There is no need to put IO in ISOLATION and hence no need to toggle ISOCLKIN and ISOIN (As core supply is still ON)) :

- WKUP event is generated by one of the IOs
- WUOUT of the last IO is asserted HIGH.
- Because of #9, PRM interrupt is generated towards MPU/Host processor
- MPU/Host processor disables the WUKP feature of each IO and power up the required domains.

DISABLING WKUP feature:

- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 1 to assert high the signal WUCLKIN.
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 0 to assert low the signal WUCLKIN.

Copyright © 2015–2019, Texas Instruments Incorporated

- The PRCM register PRM_IO_PMCTRL[9] WUCLK_STATUS logs the signal WUOUT of the last pad of the IO ring.

3.9.4.1.1 Software-Controlled I/O Isolation

The PRM_IO_PMCTRL[4] ISOOVR_EXTEND bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output, such as GPIO, while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs full-isolation-to-EMIF on the hardware-controlled I/O transition.

The PRM_IO_PMCTRL[5] IO_ON_STATUS bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-368 describes the global initialization of the surrounding modules.

Table 3-368. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a POR or software reset and then locks it to the desired synthesized clock frequency.

Table 3-369. DPLL Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure recalibration parameters.	See Section 3.10.1.1.2.2.	
Set DPLL automatic idle mode.	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx(1)
Configure synthesized clock parameters.	See Section 3.10.1.1.2.3.	
Configure output clocks parameters.	See Section 3.10.1.1.2.4.	
Lock DPLL.	CM_CLKMODE_<DPLL name>[2:0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See Section 3.6.3.3.4, *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-370. DPLL Recalibration Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status.	PRM_IRQSTATUS _<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag.	PRM_IRQENABLE _<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature.	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

3.10.1.1.2.3 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

Copyright © 2015–2019, Texas Instruments Incorporated

Table 3-371. DPLL Synthesized Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set DPLL clock synthesis multiplier.	CM_CLKSEL_<DPLL name>[18:8] DPLL_MULT	xx(1)
Set DPLL clock synthesis divider.	CM_CLKSEL_<DPLL name>[6:0] DPLL_DIV	xx(1)
IF : Low-power mode operation conditions satisfied?	Software test condition. See Section 3.6.3.3.3.	
Enable DPLL low-power operation mode.	CM_CLKMODE_<DPLL name>[10] DPLL_LPMODE_EN	0x1
ENDIF		

(1) It depends on the desired synthesized clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

3.10.1.1.2.4 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

Table 3-372. DPLL Output Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set output clock dividers (that is, M2, M3, and Hmn), where m is 1 or 2, and n is from 1 to 4. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[4:0] DIVHS CM_DIV_M3_<DPLL name>[4:0] DIVHS CM_DIV_Hmn_<DPLL name>[5:0] DIVHS	xx(1)

(1) It depends on the desired output clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

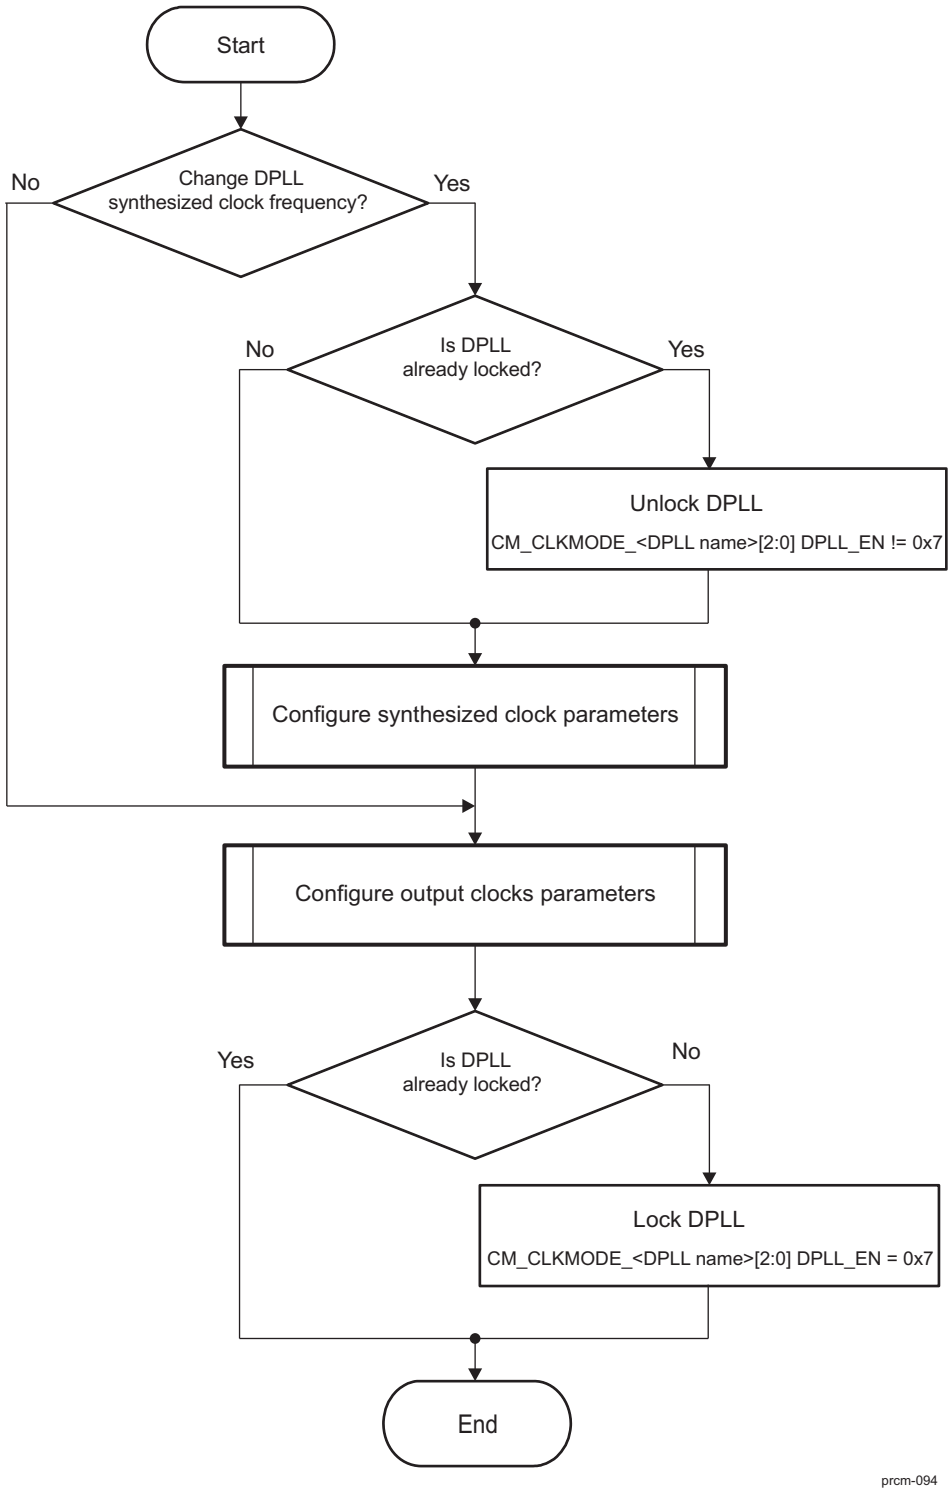
3.10.1.2 DPLL Output Frequency Change

Figure 3-88 shows the DPLL output-frequency change.

Figure 3-88. DPLL Output-Frequency Change



To unlock a DPLL, a mode different from the Lock Mode (0x7) should be programmed in the CM_CLKMODE_<DPLL NAME>[2:0] DPLL_EN bit field. The modes that can be programmed in the DPLL_EN bit field and can unlock the DPLL are:

Copyright © 2015–2019, Texas Instruments Incorporated

- For type A DPLLs: Idle Low Power bypass mode (0x5) and Idle Fast Relock bypass mode (0x6)
- For type B DPLLs: Low Power Stop mode (0x1) and Idle Low Power bypass mode (0x5)

Table 3-373 and Table 3-374 summarize register and subprocess call sequences for DPLL output frequency changes.

Table 3-373. Register Call Summary for Sequence – DPLL Output Frequency Change

Register Name
CM_CLKMODE_DPLL name

Table 3-374. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

Subprocess Name	Cross-Reference
Configure synthesized clock parameters.	See Section 3.10.1.1.2.3.
Configure output clocks parameters.	See Section 3.10.1.1.2.4.

3.10.2 Clock Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-375 describes the global initialization of the surrounding modules.

Table 3-375. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLS managed by the PRCM module are initialized.

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a POR or software reset.

Table 3-376. Clock Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain.	<Module name>_SYSCONFIG[x] MIDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx(1)
Configure module clock-management feature of slave modules in the clock domain.	See Section 3.10.3.3.	
Enable/disable static sleep dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP[x] <Destination Clock Domain name>_STATDEP	0x0: Disable 0x1: Enable
Set dynamic dependency window size.	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx(2)

(1) See the module register for valid modes.
(2) It depends on the desired size of the window. See Section 3.1.1.1.7.2, *Clock Domain Dependency*.

Table 3-376. Clock Domain Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ reques>t_<DMA/Processor name>	0x0: Disable 0x1: Enable
Set clock domain state transition feature.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	xx(3)

(3) It depends on the desired state of the clock domain. See Table 3-12.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows debugging if the transition does not occur.

Table 3-377. Clock Domain Sleep Transition and Troubleshooting

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
IF : Clock domain sleep transition not initiated?		
Check that all clock domain master modules are in standby mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check that all clock domain slave modules are in idle mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
ENDIF		

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency, use the procedure described in Table 3-378.

Table 3-378. Enable/Disable Software-Programmable Static Dependency

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2
Wait until power domain that encloses the destination domain is ON.	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency.	CM_<Src_CDname>_STATICDEP[x] Dest_CDname_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO).	CM_<Dest_CDname> _CLKSTCTRL[1:0] CLKTRCTRL	0x3

3.10.3 Power Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

Copyright © 2015–2019, Texas Instruments Incorporated

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a POR or software reset.

Table 3-379. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-380. Forced Memory Area State Change With Power Domain ON

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Get memory area current state.	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x1: RETAINED 0x3: ON

3.10.3.3 Forced Power Domain Low-Power State Transition

Table 3-381. Forced Power Domain Low-Power State Transition

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION

3.11 PRCM Software Configuration for OPP_PLUS

NOTE: For more information about the support of OPP_PLUS, see the "Operating Performance Points" section of the device Data Manual.

Copyright © 2015–2019, Texas Instruments Incorporated

NOTE: Contact your TI software support representative for details on OPP_PLUS configuration.

3.12 PRCM Register Manual

NOTE: These modules are not supported on the AM571x / AM570x family of devices:

- ATL
- VCP1, VCP2
- MLB
- USB3 (ULPI)
- FPKA
- DMA_CRYPTO

These modules are not supported on the AM570x family of devices only:

- SATA
- RTC

3.12.1 Not Supported Functionality (Registers and Bits)

NOTE: Table 3-382 shows the PRCM registers and bits which functionality is not supported in this device. Within all PRCM "*Register Description*" sections the non-functional bits are shaded.

3.12.12.2 CM_CORE_AON__MPU Register Description

Table 3-614. CM_MPU_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 5300	**Instance**	CM_CORE_AON__MPU
Description	This register enables the MPU domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							CLKACTIVITY_MPU_GCLK	RESERVED						CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:9	RESERVED		R	0x0
8	CLKACTIVITY_MPU_GCLK	This field indicates the state of the MPU_DPLL_CLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
7:2	RESERVED		R	0x0
1:0	CLKTRCTRL	Controls the clock state transition of the MPU clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

2	MODE	APLLPCIE Mode Status 0x0: APLLPCIE Mode Status	R	0x0
1:0	MODE_SELECT	Control APLL mode. **Note:**Please note that setting CM_CLKMODE_APLL_PCIE [1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE. In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. 0x0: RESERVED 0x1: Put the APLL in Force Lock mode 0x2: Put the APLL in Auto Idle mode 0x3: RESERVED	RW	0x0

3.12.19.2 CM_CORE__COREAON Register Description

Table 3-761. CM_COREAON_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 8600	**Instance**	CM_CORE__COREAON
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

3.12.20.2 CM_CORE__CORE Register Description

Table 3-784. CM_L3MAIN1_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 8700	**Instance**	CM_CORE__CORE
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																						CLKACTIVITY_L3MAIN1_L4_GICLK	CLKACTIVITY_L3MAIN1_L3_GICLK	RESERVED						CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:10	RESERVED		R	0x0
9	CLKACTIVITY_L3MAIN1_L4_GICLK	This field indicates the state of the L3MAIN1_L4_GICLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0

Copyright © 2015–2019, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
8	CLKACTIVITY_L3MAIN1_L3_GICLK	This field indicates the state of the L3MAIN1_L3_GICLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
7:2	RESERVED		R	0x0
1:0	CLKTRCTRL	Controls the clock state transition of the L3MAIN1 clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: Reserved 0x2: Reserved 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Bits	Field Name	Description	Type	Reset
14	L4SEC_STATDEP	Static dependency towards L4SEC clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0x0
13	L4PER_STATDEP	Static dependency towards L4PER1 clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0x0
12	L4CFG_STATDEP	Static dependency towards L4CFG clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0x0
11:6	RESERVED		R	0x0
5	L3MAIN1_STATDEP	Static dependency towards L3MAIN1 clock domain 0x1: Dependency is enabled	R	0x1
4	EMIF_STATDEP	Static dependency towards EMIF clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0x0
3	RESERVED		R	0x0
2	IVA_STATDEP	Static dependency towards IVA clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0x0
1:0	RESERVED		R	0x0

Table 3-947. Register Call Summary for Register CM_L3INIT_STATICDEP

Clock Management Functional Description • Clock Domain Dependency: [0][1][2][3][4][5][6][7]
PRCM Register Manual • CM_CORE__L3INIT Register Summary: [8]

Table 3-948. CM_L3INIT_DYNAMICDEP

Address Offset	0x0000 0008		
Physical Address	0x4A00 9308	**Instance**	CM_CORE__L3INIT
Description	This register controls the dynamic domain depedencies from L3INIT domain towards 'target' domains. It is relevant only for domain having OCP master port(s).		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																										L3MAIN1_DYNDEP	RESERVED				

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5	L3MAIN1_DYNDEP	Dynamic dependency towards L3MAIN1 clock domain 0x0: Dependency is disabled	R	0x0
4:0	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved	RW	0x0
