

MC100LVELT22

3.3V Dual LVTTTL/LVCMOS to Differential LVPECL Translator

Description

The MC100LVELT22 is a dual LVTTTL/LVCMOS to differential LVPECL translator. Due to LVPECL (Low Voltage Positive ECL) levels, only +3.3V and ground is required. The small 8-lead package outline with low skew dual gate design makes the MC100LVELT22 ideal for applications which require translation of a clock and/or data signal.

Features

- 350 ps Typical Propagation Delay
- <100 ps Output-to-Output Skew
- Flow Through Pinouts
- The 100 Series Contains Temperature Compensation
- LVPECL Operating Range: $V_{CC} = 3.15\text{ V}$ to 3.45 V with $GND = 0\text{ V}$
- When Unused TTL Input is left Open, Q Output will Default High
- These are Pb-Free Devices

MC100LVELT22

Figure 2. Typical MC100LVELT22 Phase Noise Plot at $f_{\text{Carrier}} = 50 \text{ MHz}$, $V_{\text{CC}} = 3.3 \text{ V}$, 25°C

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The additive RMS phase jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 219 fs. The additive RMS phase jitter performance of the translator is highly dependent on the phase noise of the input source.

To obtain the most precise additive phase noise measurement, it is vital that the source phase noise be

notably lower than that of the DUT. If the phase noise of the source is greater than the noise floor of the device under test, the source noise will dominate the additive phase jitter calculation and lead to an incorrect negative result for the additive phase noise within the integration range. The Figure above is a good example of the MC100LVELT22 source generator phase noise having a significantly lower floor than the DUT and results in an additive phase jitter of 219 fs.

$$\text{Additive RMS phase jitter} = \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2}$$

$$219 \text{ fs} = \sqrt{587.92 \text{ fs}^2 - 545.23 \text{ fs}^2}$$

Figure 2 was created with measured data from Agilent-E5052B Signal Source Analyzer using ON Semiconductor Phase Noise Explorer web tool. This free application enables an interactive environment for advanced

phase noise and jitter analysis of timing devices and clock tree designs. To see the performance of MC100LVELT22 beyond conditions outlined in this datasheet, please visit the ON Semiconductor [Green Point Design Tools](#) homepage.
