

## General Description

The MAX14874 evaluation kit (EV kit) is a fully assembled and tested circuit board that evaluates the MAX14874 dual relay/valve/motor driver

The EV kit operates from a single 4.5V to 36V supply and features an on-board linear regulator to generate a 3.3V logic supply. A terminal block allows for easy connections to evaluate operation with relays, valves, and/or motors.

## Features

- Operates from a Wide 4.5V to 36V Supply
- Proven PCB Layout
- Fully Assembled and Tested

[Ordering Information](#) appears at end of data sheet.

## Quick Start

### Recommended Equipment

- MAX14874 EV kit
- 24V, 2A power supply
- 50kHz function generator
- DC brushed motor

### Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation before exercising the full features of the device:

- 1) Verify that all the jumpers are in their default positions, as shown in [Table 1](#).
- 2) Connect the EN1 jumper (J5) to 1-2, so the M1 driver is enabled.
- 3) Connect the 24V DC power supply on the VDD and GND connectors on the EV kit board.
- 4) Connect the DC brushed motor to the M1 and GND terminals on the J8 connector.
- 5) Set the function generator to output a 0V–3.3V 50kHz signal.
- 6) Remove the shunt on the J3 jumper and connect the function generator to the IN1 test point (TP3).
- 7) Turn on the 24V supply.
- 8) Turn on the function generator.

## Detailed Description

The MAX14874 EV kit is a fully tested circuit board demonstrating the capabilities of the MAX14874 relay/valve/motor driver.

### On-Board LDO

The MAX15006A (U1) on-board LDO generates 3.3V for the logic supply (VL). Close the J2 jumper to use the MAX15006 to power VL.

To use an external supply for VL, open the J2 jumper and connect the external supply to pin 2 of the jumper.

### Fault Indicator LED

The  $\overline{\text{FAULT}}$  output asserts low when an overcurrent condition exists on M1 or M2 or when the device goes into thermal shutdown. The on-board LED (DS1) turns on when  $\overline{\text{FAULT}}$  asserts. The LED turns off when  $\overline{\text{FAULT}}$  deasserts.

### Monitoring the M1/M2 Current

Both COM1 and COM2 are connected to GND through 100mΩ resistors, for easy current monitoring. Connect a scope probe to the COM1 or COM2 pins (or on the J7 header) to monitor the current through the driver.

**Table 1. Jumper Descriptions**

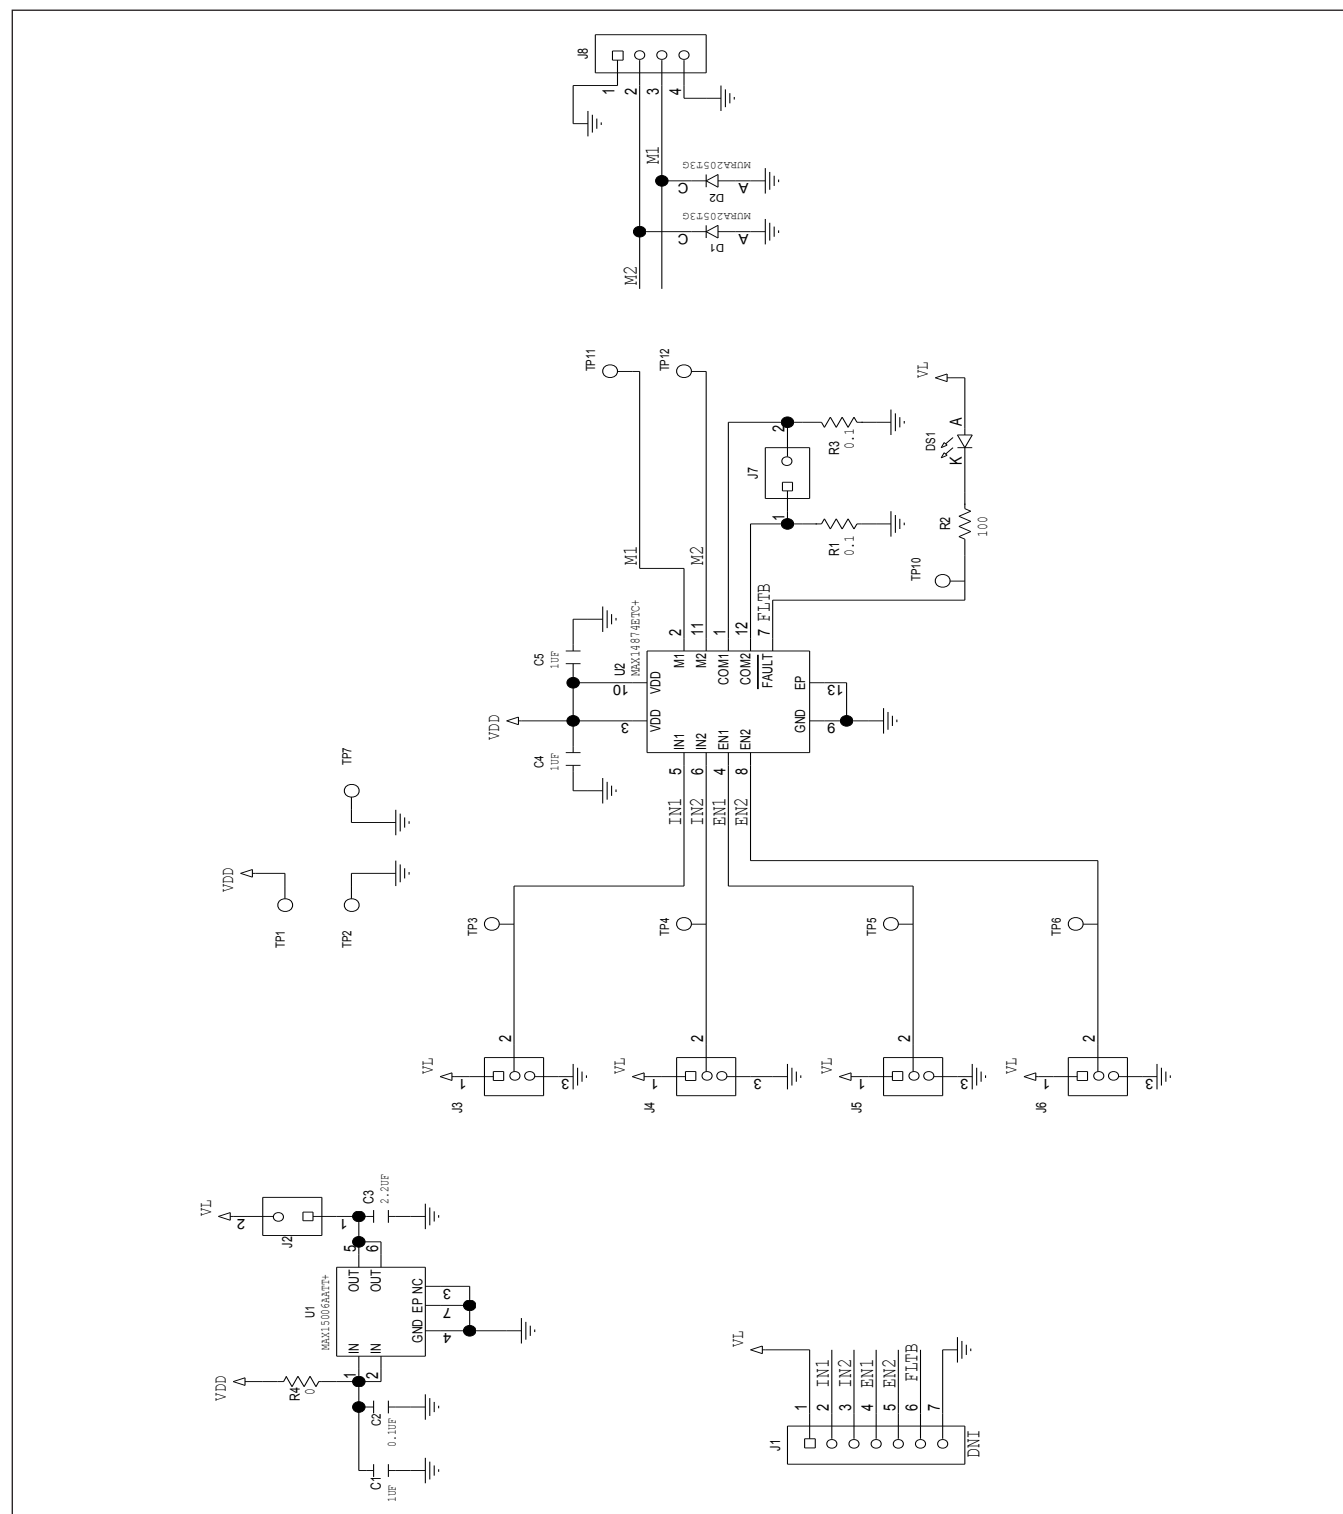

JUMPER	SHUNT POSITON	DESCRIPTION
J2	Open	VL is open.
	Closed*	VL is connected to the MAX15006A circuit. VL is 3.3V.
J3	1-2	IN1 is connected to VL.
	2-3*	IN1 is connected to GND.
J4	1-2	IN2 is connected to VL.
	2-3*	IN2 is connected to GND.
J5	1-2	EN1 is connected to VL. M1 driver is enabled.
	2-3*	EN1 is connected to GND. M1 driver is disabled.
J6	1-2	EN2 is connected to VL. M2 driver is enabled.
	2-3*	EN2 is connected to GND. M2 driver is disabled.
J7	Open*	COM1 is not connected to COM2.
	Closed	COM1 is connected to COM2.

\*Default position.
