Isolated High Current IGBT Gate Driver

NCV57080A, NCV57080B, NCV57080C

NCV57080A, NCV57080B and NCV57080C are high−current single channel IGBT gate drivers with 3.75 kVrms internal galvanic isolation, designed for high system efficiency and reliability in high power applications. The devices accept complementary inputs and depending on the pin configuration, offer options such as Active Miller Clamp (NCV57080A), negative power supply (NCV57080B) and separate high and low (OUTH and OUTL) driver outputs (NCV57080C) for system design convenience. NCV57080 (A/B/C) accommodate wide range of input bias voltage and signal levels from 3.3 V to 20 V. NCV57080 (A/B/C) are available in narrow−body SOIC−8 package.

Features

- High Peak Output Current (+8 A/−8 A)
- Low Clamp Voltage Drop Eliminates the Need of Negative Power Supply to Prevent Spurious Gate Turn−on (NCV57080A)
- Short Propagation Delays with Accurate Matching
- IGBT Gate Clamping during Short Circuit
- IGBT Gate Active Pull Down
- Tight UVLO Thresholds for Bias Flexibility
- Wide Bias Voltage Range including Negative V_{EE2} (NCV57080B)
- 3.3 V, 5 V, and 15 V Logic Input
- 3.75 kVrms Galvanic Isolation
- High Transient Immunity
- High Electromagnetic Immunity
- This Device is Pb−Free, Halogen Free/BFR Free and is RoHS Compliant
- AEC−Q100 Qualified and PPAP Capable

Typical Applications

- OBC
- PTC Heater
- e−Compressors
- Automotive Power Supplies

Table 1. FUNCTION DESCRIPTION

Pin Name	No.	I/O	Description
V_{DD1}	1	Power	Input side power supply. A good quality bypassing capacitor is required from this pin to GND1 and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than $V_{UVLO1-OUT-ON}$ is present. Please see Figure 8 for more details.
IN+	2	I	Non inverted gate driver input. It is internally clamped to V_{DD1} and has a pull−down resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative going pulse−width is required at IN+ before OUT or OUTH/OUTL responds.
IN−	3	I	Inverted gate driver input. It is internally clamped to V_{DD1} and has a pull−up resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum negative or positive going pulse−width is required at IN− before OUT or OUTH/OUTL responds.
GND1	4	Power	Input side ground reference.
V_{DD2}	5	Power	Output side positive power supply. The operating range for this pin is from UVLO2 to its maximum allowed value. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.
GND2 (NCV57080A, NCV57080C)	8	Power	Output side gate drive reference connecting to IGBT emitter or FET source.
GND2 (NCV57080B)	7		
OUT (NCV57080A, NCV57080B)	6	O	Driver output that provides the appropriate drive voltage and source/sink current to the IGBT/FET gate. OUT is actively pulled low during start−up.
OUTH (NCV57080C)	6	O	Driver high output that provides the appropriate drive voltage and source current to the IGBT/FET gate.
OUTL (NCV57080C)	7	O	Driver low output that provides the appropriate drive voltage and sink current to the IGBT/FET gate. OUTL is actively pulled low during start−up.
CLAMP (NCV57080A)	7	O	Provides clamping for the IGBT/FET gate during the off period to protect it from parasitic turn−on. Its internal N FET is turned on when the voltage of this pin falls below $V_{CLAMP-THR}$. It is to be tied directly to IGBT/FET gate with minimum trace length for best results.
V_{EE2} (NCV57080B)	8	Power	Output side negative power supply. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.

Table 2. ABSOLUTE MAXIMUM RATINGS (Note 1) Over operating free−air temperature range unless otherwise noted.

Parameter	Symbol	Minimum	Maximum	Unit
Supply voltage, input side	V_{DD1}−GND1	−0.3	22	V
Positive Power Supply, output side	V_{DD2}−GND2	−0.3	32	V
Negative Power Supply, output side	V_{EE2}−GND2	−18	0.3	V
Differential Power Supply, output side (NCV57080B)	V_{DD2}−V_{EE2} (V_{MAX2})	0	36	V
Gate−driver output high voltage NCV57080A NCV57080B NCV57080C	 V_{OUT} − GND2 V_{OUT} − GND2 V_{OUTH} − GND2		 V_{DD2} + 0.3	V
Gate−driver output low voltage NCV57080A NCV57080B NCV57080C	 V_{OUT} − GND2 V_{OUT} − V_{EE2} V_{OUTL} − GND2	−0.3		V
Gate−driver output sourcing current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V_{DD2} = 15 V, V_{EE2} = 0 V)	I_{PK-SRC}		8	A
Gate−driver output sinking current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V_{DD2} = 15 V, V_{EE2} = 0 V)	I_{PK-SNK}		8	A
Clamp sinking current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V_{CLAMP} = 2.5 V)	$I_{PK-CLAMP}$		2.5	A
Maximum Short Circuit Clamping Time (I_{OUT_CLAMP} = 500 mA)	t_{CLP}		10	μs
Voltage at IN+, IN−	V_{LIM}−GND1	−0.3	V_{DD1} + 0.3	V
Clamp Voltage	V_{CLAMP}−GND2	−0.3	V_{DD2} + 0.3	V
Power Dissipation (SOIC−8 narrow package) with 4−layer board	PD		1315	mW
Input to Output Isolation Voltage	V_{ISO}	−1200	1200	V
Maximum Junction Temperature	T_J(max)	−40	150	°C
Storage Temperature Range	T_{STG}	−65	150	°C
ESD Capability, Human Body Model (Note 2)	ESDHBM		± 2	kV
ESD Capability, Charged Device Model (Note 2)	ESDCDM		± 2	kV
Moisture Sensitivity Level	MSL		1	−
Lead Temperature Soldering Reflow, Pb−Free (Note 3)	T_{SLD}		260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
   ESD Human Body Model tested per AEC−Q100−002 (EIA/JESD22−A114).
   ESD Charged Device Model tested per AEC−Q100−011 (EIA/JESD22−C101).
   Latchup Current Maximum Rating: ≤ 100 mA per JEDEC standard: JESD78, 25°C.
3. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

Table 3. THERMAL CHARACTERISTICS

Parameter	Symbol	Value	Unit
Thermal Characteristics, SOIC−8 narrow body (Note 4) Thermal Resistance, Junction−to−Air (Note 5)	$R_{\theta JA}$	95 (4−layer board) 175 (1−layer board)	°C/W

4. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
5. Values based on copper area of 100 mm² (or 0.16 in²) of 1 oz copper thickness and FR4 PCB substrate.

Table 4. OPERATING RANGES (Note 6)

Parameter	Symbol	Min	Max	Unit
Supply voltage, input side	$V_{DD1-GND1}$	UVLO1	20	V
Positive Power Supply, output side	$V_{DD2-GND2}$	UVLO2	30	V
Negative Power Supply, output side (NCV57080B)	$V_{EE2-GND2}$	−15	0	V
Differential Power Supply, output side (NCV57080B)	$V_{DD2-VEE2}$ (V_{MAX2})	0	32	V
Low level input voltage at IN+, IN− (Note 7)	V_{IL}	0	0.3 x V_{DD1}	V
High level input voltage at IN+, IN− (Note 7)	V_{IH}	0.7 x V_{DD1}	V_{DD1}	V
Common Mode Transient Immunity	$\lvert dV_{ISO}/dt \rvert$	100		kV/μs
Ambient Temperature	T_A	−40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
7. Table values are valid for 3.3 V and 5 V V_{DD1}, for higher V_{DD1} voltages, the threshold values are maintained at the 5 V V_{DD1} levels.

Table 5. ELECTRICAL CHARACTERISTICS V_{DD1} = 5 V, V_{DD2} = 15 V, (V_{EE2} = 0 V for NCV57080B).
For typical values T_A = 25°C, for min/max values, T_A is the operating ambient temperature range that applies, unless otherwise noted.

Under Voltage Lockout (Refer to Figure 8A/8B/8C/8D)

UVLO ensures correct switching of IGBT connected to the driver output.

- The IGBT is turned−off and the output is disabled, if the supply V_{DD1} drops below $V_{UVLO1-OUT-OFF}$ or V_{DD2} drops below $V_{UVLO2-OUT-OFF}$.
- The driver output does not follow the input signal on IN+ or IN− until the V_{DDX} rises above the $V_{UVLOX-OUT-ON}$ and the input signal rising edge is applied to the IN+ or IN−
- V_{EE2} is not monitored (NCV57080B)

With high loading gate capacitances over 10 nF it is important to follow the decoupling capacitor routing guidelines as shown on Figure 32. The decoupling capacitor value should be at least 10 μF. Also gate resistor of minimal value of 2 Ω has to be used in order to avoid interference of the high di/dt with internal circuitry (e.g. UVLO2).

After the power−on of the driver there has to be a rising edge applied to the IN+ or falling edge to the IN− in order for the output to start following the inputs. This serves as a protection against producing partial pulses at the output if the V_{DD1} or V_{DD2} is applied in the middle of the input PWM pulse.

If the V_{DD2} rises over $V_{UVLO-OUT-ON}$ level the PWM will appear on the output after $t_{UVR2} + t_{UVR2-spread}$. The $t_{UVR2-spread}$ time is variable and is defined as a time from end of t_{UVR2} to first rising edge on IN+ input. If the V_{DD2} is starting from 0 V the time until PWM is at the output of the driver is longer than $t_{UVR2} + t_{UVR2-spread}$. This is caused by start up time of internal circuits of the driver.

ACTIVE MILER CLAMP PROTECTION (CLAMP)

NCV57080B supports bipolar power supply to prevent unintentional turning on.

For operation with bipolar supplies, the IGBT is turned off with a negative voltage through OUT with respect to its emitter. This prevents the IGBT from unintentionally turning on because of current induced from its collector to its gate due to Miller effect. Typical values for bipolar operation are V_{DD2} = 15 V and V_{EE2} = −5 V with respect to GND2.

NCV57080A supports unipolar power supply with active Miller clamp.

For operation with unipolar supply, typically, V_{DD2} = 15 V with respect to GND2, and V_{EE2} = GND2. In this case, the IGBT can turn on due to additional charge from IGBT Miller capacitance caused by a high voltage slew rate transition on the IGBT collector. To prevent IGBT to turn on, the CLAMP pin is connected directly to IGBT gate and Miller current is sinked through a low impedance CLAMP transistor. When the IGBT is turned−off and the gate voltage transitions below V_{CLAMP}, the CLAMP output is activated

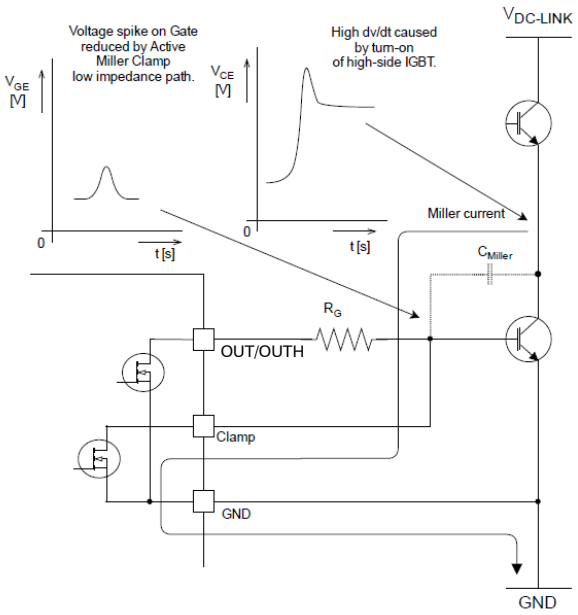

Figure 25. Current Path with Miler Clamp Protection

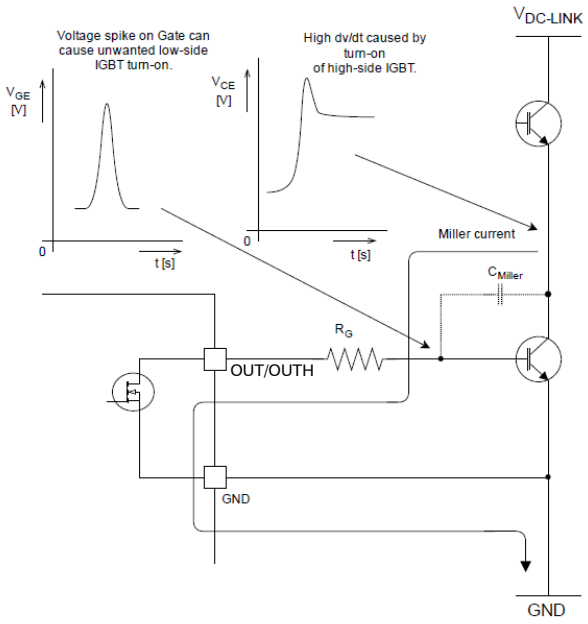

Figure 26. Current Path without Miler Clamp Protection

Non−inverting and Inverting Input Pin (IN+, IN−)

NCV57080x has two possible input modes to control IGBT. Both inputs have defined minimum input pulse width to filter occasional glitches.

- Non−inverting input IN+ controls the driver output while inverting input IN− is set to LOW
- Inverting input IN− controls the driver output while non−inverting input IN+ is set to HIGH

WARNING: When the application uses an independent or separate power supply for the control unit and the input side of the driver, all inputs should be protected by a serial resistor (In case of a power failure of the driver, the driver may be damaged due to overloading of the input protection circuits)

Power Supply (V_{DD1}, V_{DD2}, V_{EE2})

NCV57080A and NCV57080C are designed to support unipolar power supply.

NCV57080B is designed to support bipolar power supply.

For reliable high output current delivery suitable external power capacitors are required. Parallel combination of 100 nF + 4.7 μF ceramic capacitors is optimal for a wide range of applications using IGBT. For reliable driving of IGBT modules (containing several parallel IGBTs) a higher capacity is required (typically 100 nF + 10 μF). Capacitors should be as close as possible to the driver's power pins.

- In bipolar power supply the driver is typically supplied with a positive voltage of 15 V at V_{DD2} and negative voltage −5 V at V_{EE2} (Figure 27). Negative power supply prevents a dynamic turn on through the internal IGBT input capacitance
- In Unipolar power supply the driver is typically supplied with a positive voltage of 15 V at V_{DD2}. Dynamic turn on through the internal IGBT input capacitance could be prevented by Active Miler Clamp function (NCV57080A). CLAMP output should be directly connected to IGBT gate (Figure 25)
