

## TLV900x Low-Power, RRIO, 1-MHz Operational Amplifier for Cost-Sensitive Systems

### 1 Features

- Scalable CMOS amplifier for low-cost applications
- Rail-to-rail input and output
- Low input offset voltage:  $\pm 0.4$  mV
- Unity-gain bandwidth: 1 MHz
- Low broadband noise:  $27$  nV/ $\sqrt{\text{Hz}}$
- Low input bias current: 5 pA
- Low quiescent current: 60  $\mu\text{A}/\text{Ch}$
- Unity-gain stable
- Internal RFI and EMI filter
- Operational at supply voltages as low as 1.8 V
- Easier to stabilize with higher capacitive load due to resistive open-loop output impedance
- Extended temperature range:  $-40^\circ\text{C}$  to  $125^\circ\text{C}$

### 2 Applications

- Smoke detectors
- Motion detectors
- Wearable devices
- Large and small appliances
- EPOS
- Barcode scanners
- Sensor signal conditioning
- Power modules
- Personal electronics
- Active filters
- HVAC: heating, ventilating, and air conditioning
- Motor control: AC induction
- Low-side current sensing

### 3 Description

The TLV900x family includes single (TLV9001), dual (TLV9002), and quad-channel (TLV9004) low-voltage (1.8 V to 5.5 V) operational amplifiers (op amps) with rail-to-rail input and output swing capabilities. These op amps provide a cost-effective solution for space-constrained applications such as smoke detectors, wearable electronics, and small appliances where low-voltage operation and high capacitive-load drive are required. The capacitive-load drive of the TLV900x family is 500 pF, and the resistive open-loop output impedance makes stabilization easier with much higher capacitive loads. These op amps are designed specifically for low-voltage operation (1.8 V to 5.5 V) with performance specifications similar to the TLV600x devices.

The robust design of the TLV900x family simplifies circuit design. The op amps feature unity-gain stability, an integrated RFI and EMI rejection filter, and no-phase reversal in overdrive conditions.

The TLV900x devices include a shutdown mode (TLV9001S, TLV9002S and TLV9004S) that allow the amplifiers to switch off into standby mode with typical current consumption less than 1  $\mu\text{A}$ .

Micro-size packages, such as SOT-553 and WSON, are offered for all channel variants (single, dual, and quad), along with industry-standard packages such as SOIC, MSOP, SOT-23, and TSSOP packages.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TLV9001	SOT-23 (5)	1.60 mm x 2.90 mm
	SC70 (5)	1.25 mm x 2.00 mm
	SOT-553 (5) <sup>(2)</sup>	1.65 mm x 1.20 mm
	X2SON (5)	0.80 mm x 0.80 mm
TLV9001S	SOT-23 (6)	1.60 mm x 2.90 mm
	SC70 (6)	1.25 mm x 2.00 mm
TLV9002	SOIC (8)	3.91 mm x 4.90 mm
	WSON (8)	2.00 mm x 2.00 mm
	VSSOP (8)	3.00 mm x 3.00 mm
	SOT-23 (8)	1.60 mm x 2.90 mm
	TSSOP (8)	3.00 mm x 4.40 mm
TLV9002S	VSSOP (10)	3.00 mm x 3.00 mm
	X2QFN (10)	1.50 mm x 2.00 mm
TLV9004	SOIC (14)	8.65 mm x 3.91 mm
	TSSOP (14)	4.40 mm x 5.00 mm
	WQFN (16)	3.00 mm x 3.00 mm
	X2QFN (14)	2.00 mm x 2.00 mm
TLV9004S	WQFN (16)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) Package is for preview only.

#### Single-Pole, Low-Pass Filter

$$\frac{V_{OUT}}{V_{IN}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1C_1}\right)$$

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision N (January 2020) to Revision O</b>	<b>Page</b>
• Deleted PREVIEW designation on TLV9001S .....	<b>1</b>
• Deleted TLV9001SIDCK (6-pin SC70) package preview note .....	<b>8</b>
• Added DCK (SC70) data to the Thermal Information: TLV9001S table .....	<b>15</b>

<b>Changes from Revision M (September 2019) to Revision N</b>	<b>Page</b>
• Added 6-pin SC70 package to <i>Device Information</i> table .....	<b>1</b>
• Added 6-pin SC70 package to <i>Device Comparison Table</i> .....	<b>6</b>
• Added TLV9001SIDCK (6-Pin SC70) package pinout .....	<b>8</b>
• Added TLV9001S 6-pin SC70 package to <i>Pin Configuration and Functions</i> section .....	<b>8</b>
• Added 6-pin SC70 pinout to <i>Pin Functions: TLV9001S</i> .....	<b>8</b>
• Added TLV9001S 6-pin SC70 package to <i>Thermal Information: TLV9001S</i> table .....	<b>15</b>

<b>Changes from Revision L (May 2019) to Revision M</b>	<b>Page</b>
• Deleted preview notations for SOT-23-8 (DDF) package .....	<b>6</b>
• Added link to <i>Shutdown</i> section in all $\overline{\text{SHDN}}$ pin function rows .....	<b>8</b>
• Added <i>EMI Rejection</i> section to the <i>Feature Description</i> section .....	<b>26</b>
• Changed the <i>Shutdown</i> section to add more clarity regarding internal pull-up resistor .....	<b>27</b>

---

**Changes from Revision K (March 2019) to Revision L** **Page**

---

• Added SOT-23 (8) information to <i>Device Information</i> table .....	1
• Added SOT-23 DDF package to <i>Device Comparison Table</i> .....	6
• Added SOT-23 (DDF) to <i>Pin Configuration and Functions</i> section .....	9
• Added DDF (SOT-23) <i>Thermal Information: TLV9002</i> table .....	15

---

**Changes from Revision J (January 2019) to Revision K** **Page**

---

• Changed TLV9002S <i>ESD Ratings</i> heading to include all TLV9002S packages .....	14
• Deleted preview notation from TLV9002SIRUG in <i>Thermal Information</i> table .....	15

---

**Changes from Revision I (November 2018) to Revision J** **Page**

---

• Deleted preview notation for TLV9002SIRUGR .....	1
• Changed TLV9004 WQFN(14) package designator to X2QFN(14) package designator .....	1
• Added RUG package to <i>Device Comparison Table</i> .....	6
• Added DGS package to <i>Device Comparison Table</i> .....	6
• Added shutdown devices to <i>Device Comparison Table</i> .....	6
• Changed TLV9001 DRL package pinout drawing .....	7
• Changed TLV9001 DRL package pin functions .....	7
• Deleted package preview note from TLV9002SIRUGR (X2QFN) pinout drawing .....	10
• Added TLV9004IRUC Thermal Information .....	16
• Changed legend of Closed-Loop Gain vs Frequency plot .....	19

---

**Changes from Revision H (October 2018) to Revision I** **Page**

---

• Added TLV9002SIDGS to <i>ESD Ratings</i> table .....	14
--	----

---

**Changes from Revision G (September 2018) to Revision H** **Page**

---

• Changed From: TLV9001 DCK Package To: TLV9001T DCK Package .....	7
--	---

---

**Changes from Revision F (August 2018) to Revision G** **Page**

---

• Added <i>Device Comparison Table</i> .....	6
• Changed pin names for all devices and all packages .....	7
• Changed pin names and I/O designation on some TLV9001 pins .....	7
• Changed the pin number for V+ in the <i>SOIC, TSSOP</i> column of the <i>Pin Functions: TLV9004</i> table .....	12

---

**Changes from Revision E (July 2018) to Revision F** **Page**

---

• Added Scalable CMOS Amplifier for Low-Cost Applications feature .....	1
• Deleted PREVIEW designation on TLV9002 and TLV9004 devices with the TSSOP package. ....	1
• Added TLV9001U DBV (SOT-23) pinout drawing to <i>Pin Configuration and Functions</i> section .....	7
• Added SOT-23 U Pinout to <i>Pin Functions</i> section .....	7

---

<b>Changes from Revision D (June 2018) to Revision E</b>	<b>Page</b>
• Corrected typo in <i>Description</i> section .....	1
• Added TLV9001 5-pin X2SON package to <i>Device Information</i> table .....	1
• Added TLV9001S 6-pin SOT-23 package to <i>Device Information</i> table .....	1
• Added TLV9004 14-pin and 16-pin WQFN packages to <i>Device Information</i> table .....	1
• Added TLV9001 DPW (X2SON) pinout drawing to <i>Pin Configuration and Functions</i> section .....	7
• Added TLV9001S 6-pin SOT-23 package to <i>Pin Configuration and Functions</i> section .....	8
• Added TLV9004 RTE pinout information to <i>Pin Configuration and Functions</i> section .....	11
• Added DPW (X2SON) and DRL (SOT-553) packages to <i>Thermal Information: TLV9001</i> table .....	15
• Added <i>Thermal Information: TLV9001S</i> table to <i>Specifications</i> section .....	15
• Added RUG (X2QFN) package to <i>Thermal Information: TLV9002</i> table .....	15
• Added RTE (WQFN) and RUC (WQFN) packages to <i>Thermal Information: TLV9004</i> table .....	16

<b>Changes from Revision C (May 2018) to Revision D</b>	<b>Page</b>
• Added shutdown text to <i>Description</i> section .....	1
• Added TLV9002S and TLV9004S devices to <i>Device Information</i> table .....	1
• Added TLV9002S 10-pin X2QFN package to <i>Device Information</i> table .....	1
• Added TLV9002S DGS package pinout information to <i>Pin Configurations and Functions</i> section .....	9
• Added <i>Thermal Information: TLV9001</i> table to <i>Specifications</i> section .....	15
• Added <i>Thermal Information: TLV9004</i> table to <i>Specifications</i> section .....	16
• Added shutdown section to <i>Electrical Characteristics: <math>V_S</math> (Total Supply Voltage) = (V+) – (V–) = 1.8 V to 5.5 V</i> table .....	17
• Added <i>Shutdown</i> section .....	27

<b>Changes from Revision B (March 2018) to Revision C</b>	<b>Page</b>
• Added TLV9002 16-pin TSSOP package to <i>Device Information</i> table .....	1
• Added TLV9002 10-pin X2QFN package to <i>Device Information</i> table .....	1
• Added TLV9002S DGS package pinout drawing in <i>Pin Configurations and Functions</i> section .....	10
• Added TLV9004 pinout diagram and pin configuration table to <i>Pin Configuration and Functions</i> section .....	11
• Added TLV9004S pinout diagram and pin configuration table to <i>Pin Configuration and Functions</i> section .....	13
• Changed TLV9002 D (SOIC) junction-to-ambient thermal resistance value from 147.4°C/W to 207.9°C/W .....	15
• Changed TLV9002 D (SOIC) junction-to-case (top) thermal resistance from 94.3°C/W to 92.8°C/W .....	15
• Changed TLV9002 D (SOIC) junction-to-board thermal resistance from 89.5°C/W to 129.7°C/W .....	15
• Changed TLV9002 D (SOIC) junction-to-top characterization parameter from 47.3°C/W to 26°C/W .....	15
• Changed TLV9002 D (SOIC) junction-to-board characterization parameter from 89°C/W to 127.9°C/W .....	15
• Added DGK (VSSOP) thermal information to <i>Thermal Information: TLV9002</i> table .....	15
• Added TLV9002 PW (TSSOP) thermal information to <i>Thermal Information: TLV9002</i> table .....	15
• Added PW (TSSOP) thermal information to <i>Thermal Information: TLV9002</i> table .....	16

<b>Changes from Revision A (December 2017) to Revision B</b>	<b>Page</b>
• Added package preview notes to TLV9001 packages, TLV9004 packages, and TLV9002 8-pin VSSOP package in <i>Device Information</i> table .....	1
• Added package preview notes to TLV9001, TLV9004 and TLV9002 VSSOP package pinout drawings in <i>Pin Configuration and Functions</i> section .....	7
• Deleted package preview note from TLV9002 DSG (WSON) pinout drawing in <i>Pin Configurations and Functions</i> section .....	9

- Deleted package preview note from TLV9002 RUG (X2QFN) pinout drawing in *Pin Configurations and Functions* section ..... 10
  - Added DSG (WSON) package thermal information to the *Thermal Information: TLV9002* table ..... 15
  - Deleted package preview note from DSG (WSON) package in *Thermal Information: TLV9002* table ..... 15
  - Added D (SOIC) package thermal information to the *Thermal Information: TLV9004* table ..... 16
-

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 over operating temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
Supply voltage (V+) – (V–)			6		V
Signal input pins	Voltage <sup>(2)</sup>	Common-mode	(V–) – 0.5	(V+) + 0.5	V
		Differential	(V+) – (V–) + 0.2		V
	Current <sup>(2)</sup>	–10                      10		mA	
Output short-circuit <sup>(3)</sup>			Continuous		
Operating, T <sub>A</sub>			–55	150	°C
Junction, T <sub>J</sub>				150	°C
Storage, T <sub>stg</sub>			–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Input pins are diode-clamped to the power-supply rails. Input signals that may swing more than 0.5 V beyond the supply rails must be current limited to 10 mA or less.

(3) Short-circuit to ground, one amplifier per package.

### 7.2 ESD Ratings

TLV9002S PACKAGE			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	
ALL OTHER PACKAGES				
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V <sub>S</sub>	Supply voltage		1.8	5.5	V
T <sub>A</sub>	Specified temperature		–40	125	°C

## 7.4 Thermal Information: TLV9001

THERMAL METRIC <sup>(1)</sup>		TLV9001				UNIT
		DBV (SOT-23)	DCK (SC70)	DPW (X2SON)	DRL (SOT-553) <sup>(2)</sup>	
		5 PINS	5 PINS	5 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	232.9	239.6	470.0	TBD	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	153.8	148.5	211.9	TBD	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	100.9	82.3	334.8	TBD	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	77.2	54.5	29.8	TBD	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	100.4	81.8	333.2	TBD	°C/W

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

(2) This package option for TLV9001 is preview only.

## 7.5 Thermal Information: TLV9001S

THERMAL METRIC <sup>(1)</sup>		TLV9001S		UNIT
		DBV (SOT-23)	DCK (SC70)	
		6 PINS	6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	232.9	215.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	153.8	146.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	100.9	72.0	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	77.2	55.0	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	100.4	71.7	°C/W

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

## 7.6 Thermal Information: TLV9002

$Z_O$	Open-loop output impedance	$V_S = 5\text{ V}$ , $f = 1\text{ MHz}$		1200		$\Omega$

## Electrical Characteristics (continued)

For  $V_S = (V+) - (V-) = 1.8\text{ V to }5.5\text{ V}$  ( $\pm 0.9\text{ V to } \pm 2.75\text{ V}$ ),  $T_A = 25^\circ\text{C}$ ,  $R_L = 10\text{ k}\Omega$  connected to  $V_S / 2$ , and  $V_{CM} = V_{OUT} = V_S / 2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY</b>						
$V_S$	Specified voltage range		1.8 ( $\pm 0.9$ )		5.5 ( $\pm 2.75$ )	V
$I_Q$	Quiescent current per amplifier	TLV9002, TLV9002S TLV9004, TLV9004S	$I_O = 0\text{ mA}$ , $V_S = 5.5\text{ V}$	60	75	$\mu\text{A}$
		TLV9001, TLV9001S				
				$I_O = 0\text{ mA}$ , $V_S = 5.5\text{ V}$ , $T_A = -40^\circ\text{C to }125^\circ\text{C}$		
<b>SHUTDOWN<sup>(1)</sup></b>						
$I_{QSD}$	Quiescent current per amplifier	$V_S = 1.8\text{ V to }5.5\text{ V}$ , all amplifiers disabled, $\overline{\text{SHDN}} = V_{S-}$		0.5	1.5	$\mu\text{A}$
$Z_{SHDN}$	Output impedance during shutdown	$V_S = 1.8\text{ V to }5.5\text{ V}$ , amplifier disabled		10    2		$\text{G}\Omega \parallel \text{pF}$
	High level voltage shutdown threshold (amplifier enabled)	$V_S = 1.8\text{ V to }5.5\text{ V}$		( $V_-$ ) + 0.9	( $V_-$ ) + 1.1	V
	Low level voltage shutdown threshold (amplifier disabled)	$V_S = 1.8\text{ V to }5.5\text{ V}$	( $V_-$ ) + 0.2 V	( $V_-$ ) + 0.7 V		V
$t_{ON}$	Amplifier enable time (full shutdown) <sup>(2)(3)</sup>	$V_S = 1.8\text{ V to }5.5\text{ V}$ , full shutdown; $G = 1$ , $V_{OUT} = 0.9 \times V_S / 2$ , $R_L$ connected to $V_-$		70		$\mu\text{s}$
	Amplifier enable time (partial shutdown) <sup>(2)(3)</sup>	$V_S = 1.8\text{ V to }5.5\text{ V}$ , partial shutdown; $G = 1$ , $V_{OUT} = 0.9 \times V_S / 2$ , $R_L$ connected to $V_-$		50		
$t_{OFF}$	Amplifier disable time <sup>(2)</sup>	$V_S = 1.8\text{ V to }5.5\text{ V}$ , $G = 1$ , $V_{OUT} = 0.1 \times V_S / 2$ , $R_L$ connected to $V_-$		4		$\mu\text{s}$
	$\overline{\text{SHDN}}$ pin input bias current (per pin)	$V_S = 1.8\text{ V to }5.5\text{ V}$ , $V_+ \geq \overline{\text{SHDN}} \geq (V_+) - 0.8\text{ V}$		40		nA
		$V_S = 1.8\text{ V to }5.5\text{ V}$ , $V_- \leq \overline{\text{SHDN}} \leq V_- + 0.8\text{ V}$		150		

(1) Specified by design and characterization; not production tested.

(2) Disable time ( $t_{OFF}$ ) and enable time ( $t_{ON}$ ) are defined as the time interval between the 50% point of the signal applied to the  $\overline{\text{SHDN}}$  pin and the point at which the output voltage reaches the 10% (disable) or 90% (enable) level.

(3) Full shutdown refers to the dual TLV9002S having both channels 1 and 2 disabled ( $\overline{\text{SHDN}}1 = \overline{\text{SHDN}}2 = V_-$ ) and the quad TLV9004S having all channels 1 to 4 disabled ( $\overline{\text{SHDN}}12 = \overline{\text{SHDN}}34 = V_-$ ). For partial shutdown, only one  $\overline{\text{SHDN}}$  pin is exercised; in this mode, the internal biasing circuitry remains operational and the enable time is shorter.

## 8 Detailed Description

### 8.1 Overview

The TLV900x is a family of low-power, rail-to-rail input and output op amps. These devices operate from 1.8 V to 5.5 V, are unity-gain stable, and are designed for a wide range of general-purpose applications. The input common-mode voltage range includes both rails and allows the TLV900x family to be used in virtually any single-supply application. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications, and makes them suitable for driving sampling analog-to-digital converters (ADCs).

### 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Operating Voltage

The TLV900x family of op amps are for operation from 1.8 V to 5.5 V. In addition, many specifications such as input offset voltage, quiescent current, offset current, and short circuit current apply from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . Parameters that vary significantly with operating voltages or temperature are shown in the [Typical Characteristics](#) section.

### 8.3.2 Rail-to-Rail Input

The input common-mode voltage range of the TLV900x family extends 100 mV beyond the supply rails for the full supply voltage range of 1.8 V to 5.5 V. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in the [Functional Block Diagram](#). The N-channel pair is active for input voltages close to the positive rail, typically  $(V+) - 1.4\text{ V}$  to 100 mV above the positive supply, whereas the P-channel pair is active for inputs from 100 mV below the negative supply to approximately  $(V+) - 1.4\text{ V}$ . There is a small transition region, typically  $(V+) - 1.2\text{ V}$  to  $(V+) - 1\text{ V}$ , in which both pairs are on. This 100-mV transition region can vary up to 100 mV with process variation. Thus, the transition region (with both stages on) can range from  $(V+) - 1.4\text{ V}$  to  $(V+) - 1.2\text{ V}$  on the low end, and up to  $(V+) - 1\text{ V}$  to  $(V+) - 0.8\text{ V}$  on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can degrade compared to device operation outside this region.

### 8.3.3 Rail-to-Rail Output

Designed as a low-power, low-voltage operational amplifier, the TLV900x family delivers a robust output drive capability. A class-AB output stage with common-source transistors achieves full rail-to-rail output swing capability. For resistive loads of 10 k $\Omega$ , the output swings to within 20 mV of either supply rail, regardless of the applied power-supply voltage. Different load conditions change the ability of the amplifier to swing close to the rails.

### 8.3.4 EMI Rejection

The TLV900x uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the TLV900x benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. [Figure 37](#) shows the results of this testing on the TLV900x. [Table 1](#) shows the EMIRR IN+ values for the TLV900x at particular frequencies commonly encountered in real-world applications. The [EMI Rejection Ratio of Operational Amplifiers](#) application report contains detailed information on the topic of EMIRR performance as it relates to op amps and is available for download from [www.ti.com](http://www.ti.com).

**Figure 37. EMIRR Testing**

## Feature Description (continued)

**Table 1. TLV900x EMIRR IN+ For Frequencies of Interest**

FREQUENCY	APPLICATION OR ALLOCATION	EMIRR IN+
400 MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	59.5 dB
900 MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6 GHz), GSM, aeronautical mobile, UHF applications	68.9 dB
1.8 GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1 GHz to 2 GHz)	77.8 dB
2.4 GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2 GHz to 4 GHz)	78.0 dB
3.6 GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	88.8 dB

### 8.3.5 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, because of the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return to the linear state. After the charge carriers return to the linear state, the device begins to slew at the specified slew rate. Therefore, the propagation delay (in case of an overload condition) is the sum of the overload recovery time and the slew time. The overload recovery time for the TLV900x family is approximately 850 ns.

### 8.3.6 Shutdown

The TLV9001S, TLV9002S and TLV9004S devices feature  $\overline{\text{SHDN}}$  pins that disable the op amp, placing it into a low-power standby mode. In this mode, the op amp typically consumes less than 1  $\mu\text{A}$ . The SHDN pins are active low, meaning that shutdown mode is enabled when the input to the SHDN pin is a valid logic low.

The  $\overline{\text{SHDN}}$  pins are referenced to the negative supply voltage of the op amp. The threshold of the shutdown feature lies around 620 mV (typical) and does not change with respect to the supply voltage. Hysteresis has been included in the switching threshold to ensure smooth switching characteristics. To ensure optimal shutdown behavior, the  $\overline{\text{SHDN}}$  pins should be driven with valid logic signals. A valid logic low is defined as a voltage between  $V_-$  and  $V_- + 0.2\text{ V}$ . A valid logic high is defined as a voltage between  $V_- + 1.2\text{ V}$  and  $V_+$ . The shutdown pin circuitry includes a pull-up resistor, which will inherently pull the voltage of the pin to the positive supply rail if not driven. Thus, to enable the amplifier, the  $\overline{\text{SHDN}}$  pins should either be left floating or driven to a valid logic high. To disable the amplifier, the  $\overline{\text{SHDN}}$  pins must be driven to a valid logic low. While we highly recommend that the shutdown pin be connected to a valid high or a low voltage or driven, we have included a pull-up resistor connected to VCC. The maximum voltage allowed at the  $\overline{\text{SHDN}}$  pins is  $(V_+) + 0.5\text{ V}$ . Exceeding this voltage level will damage the device.

The  $\overline{\text{SHDN}}$  pins are high-impedance CMOS inputs. Dual op amp versions are independently controlled and quad op amp versions are controlled in pairs with logic inputs. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is 70  $\mu\text{s}$  for full shutdown of all channels; disable time is 4  $\mu\text{s}$ . When disabled, the output assumes a high-impedance state. This architecture allows the TLV9002S and TLV9004S to operate as a gated amplifier (or to have the device output multiplexed onto a common analog output bus). Shutdown time ( $t_{\text{OFF}}$ ) depends on loading conditions and increases as load resistance increases. To ensure shutdown (disable) within a specific shutdown time, the specified 10-k $\Omega$  load to midsupply ( $V_S / 2$ ) is required. If using the TLV9001S, TLV9002S or TLV9004S without a load, the resulting turnoff time significantly increases.

## 8.4 Device Functional Modes

The TLV900x family has a single functional mode. The devices are powered on as long as the power-supply voltage is between 1.8 V ( $\pm 0.9\text{ V}$ ) and 5.5 V ( $\pm 2.75\text{ V}$ ).

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TLV900x family of low-power, rail-to-rail input and output operational amplifiers is specifically designed for portable applications. The devices operate from 1.8 V to 5.5 V, are unity-gain stable, and are suitable for a wide range of general-purpose applications. The class AB output stage is capable of driving less than or equal to 10-k $\Omega$  loads connected to any point between V+ and V-. The input common-mode voltage range includes both rails, and allows the TLV900x devices to be used in any single-supply application.

### 9.2 Typical Application

#### 9.2.1 TLV900x Low-Side, Current Sensing Application

Figure 38 shows the TLV900x configured in a low-side current sensing application.

**Figure 38. TLV900x in a Low-Side, Current-Sensing Application**

## Typical Application (continued)

### 9.2.1.1 Design Requirements

The design requirements for this design are:

- Load current: 0 A to 1 A
- Output voltage: 4.9 V
- Maximum shunt voltage: 100 mV

### 9.2.1.2 Detailed Design Procedure

The transfer function of the circuit in [Figure 38](#) is given in [Equation 1](#).

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times \text{Gain} \quad (1)$$

The load current ( $I_{LOAD}$ ) produces a voltage drop across the shunt resistor ( $R_{SHUNT}$ ). The load current is set from 0 A to 1 A. To keep the shunt voltage below 100 mV at maximum load current, the largest shunt resistor is shown using [Equation 2](#).

$$R_{SHUNT} = \frac{V_{SHUNT\_MAX}}{I_{LOAD\_MAX}} = \frac{100\text{mV}}{1\text{A}} = 100\text{m}\Omega \quad (2)$$

Using [Equation 2](#),  $R_{SHUNT}$  is calculated to be 100 m $\Omega$ . The voltage drop produced by  $I_{LOAD}$  and  $R_{SHUNT}$  is amplified by the TLV900x to produce an output voltage of approximately 0 V to 4.9 V. The gain needed by the TLV900x to produce the necessary output voltage is calculated using [Equation 3](#).

$$\text{Gain} = \frac{(V_{OUT\_MAX} - V_{OUT\_MIN})}{(V_{IN\_MAX} - V_{IN\_MIN})} \quad (3)$$

Using [Equation 3](#), the required gain is calculated to be 49 V/V, which is set with resistors  $R_F$  and  $R_G$ . [Equation 4](#) sizes the resistors  $R_F$  and  $R_G$ , to set the gain of the TLV900x to 49 V/V.

$$\text{Gain} = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Selecting  $R_F$  as 57.6 k $\Omega$  and  $R_G$  as 1.2 k $\Omega$  provides a combination that equals 49 V/V. [Figure 39](#) shows the measured transfer function of the circuit shown in [Figure 38](#). Notice that the gain is only a function of the feedback and gain resistors. This gain is adjusted by varying the ratio of the resistors and the actual resistors values are determined by the impedance levels that the designer wants to establish. The impedance level determines the current drain, the effect that stray capacitance has, and a few other behaviors. There is no optimal impedance selection that works for every system, you must choose an impedance that is ideal for your system parameters.

### 9.2.1.3 Application Curve

**Figure 39. Low-Side, Current-Sense Transfer Function**

## Typical Application (continued)

### 9.2.2 Single-Supply Photodiode Amplifier

Photodiodes are used in many applications to convert light signals to electrical signals. The current through the photodiode is proportional to the photon energy absorbed, and is commonly in the range of a few hundred picoamps to a few tens of microamps. An amplifier in a transimpedance configuration is typically used to convert the low-level photodiode current to a voltage signal for processing in an MCU. The circuit shown in [Figure 40](#) is an example of a single-supply photodiode amplifier circuit using the TLV9002.

**Figure 40. Single-Supply Photodiode Amplifier Circuit**

## Typical Application (continued)

### 9.2.2.1 Design Requirements

The design requirements for this design are:

- Supply voltage: 3.3 V
- Input: 0  $\mu$ A to 10  $\mu$ A
- Output: 0.1 V to 3.2 V
- Bandwidth: 50 kHz

### 9.2.2.2 Detailed Design Procedure

The transfer function between the output voltage ( $V_{OUT}$ ), the input current, ( $I_{IN}$ ) and the reference voltage ( $V_{REF}$ ) is defined in [Equation 5](#).

$$V_{OUT} = I_{IN} \times R_F + V_{REF} \quad (5)$$

Where:

$$V_{REF} = V_+ \times \left( \frac{R_1 \times R_2}{R_1 + R_2} \right) \quad (6)$$

Set  $V_{REF}$  to 100 mV to meet the minimum output voltage level by setting R1 and R2 to meet the required ratio calculated in [Equation 7](#).

$$\frac{V_{REF}}{V_+} = \frac{0.1 \text{ V}}{3.3 \text{ V}} = 0.0303 \quad (7)$$

The closest resistor ratio to meet this ratio sets R1 to 11.5 k $\Omega$  and R2 to 357  $\Omega$ .

The required feedback resistance can be calculated based on the input current and desired output voltage.

$$R_F = \frac{V_{OUT} - V_{REF}}{I_{IN}} = \frac{3.2 \text{ V} - 0.1 \text{ V}}{10 \mu\text{A}} = 310 \frac{\text{kV}}{\text{A}} \approx 309 \text{ k}\Omega \quad (8)$$

Calculate the value for the feedback capacitor based on  $R_F$  and the desired –3-dB bandwidth, ( $f_{-3dB}$ ) using [Equation 9](#).

$$C_F = \frac{1}{2 \times \pi \times R_F \times f_{-3dB}} = \frac{1}{2 \times \pi \times 309 \text{ k}\Omega \times 50 \text{ kHz}} = 10.3 \text{ pF} \approx 10 \text{ pF} \quad (9)$$

The minimum op amp bandwidth required for this application is based on the value of  $R_F$ ,  $C_F$ , and the capacitance on the INx– pin of the TLV9002 which is equal to the sum of the photodiode shunt capacitance, (CPD) the common-mode input capacitance, (CCM) and the differential input capacitance (CD) as [Equation 10](#) shows.

$$C_{IN} = C_{PD} + C_{CM} + C_D = 47 \text{ pF} + 5 \text{ pF} + 1 \text{ pF} = 53 \text{ pF} \quad (10)$$

The minimum op amp bandwidth is calculated in [Equation 11](#).

$$f_{-BGW} \geq \frac{C_{IN} + C_F}{2 \times \pi \times R_F \times C_F^2} \geq 324 \text{ kHz} \quad (11)$$

The 1-MHz bandwidth of the TLV900x meets the minimum bandwidth requirement and remains stable in this application configuration.

## Typical Application (continued)

### 9.2.2.3 Application Curves

The measured current-to-voltage transfer function for the photodiode amplifier circuit is shown in [Figure 41](#). The measured performance of the photodiode amplifier circuit is shown in [Figure 42](#).

## 10 Power Supply Recommendations

The TLV900x family is specified for operation from 1.8 V to 5.5 V ( $\pm 0.9$  V to  $\pm 2.75$  V); many specifications apply from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The [Typical Characteristics](#) section presents parameters that may exhibit significant variance with regard to operating voltage or temperature.

### CAUTION

Supply voltages larger than 6 V may permanently damage the device; see the [Absolute Maximum Ratings](#) table.

Place 0.1- $\mu\text{F}$  bypass capacitors close to the power-supply pins to reduce coupling errors from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the [Layout Guidelines](#) section.

### 10.1 Input and ESD Protection

The TLV900x family incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA. [Figure 43](#) shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

**Figure 43. Input Current Protection**

## 11 Layout

### 11.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power connections of the board and propagate to the power pins of the op amp itself. Bypass capacitors are used to reduce the coupled noise by providing a low-impedance path to ground.
  - Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is adequate for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace at a 90 degree angle is much better as opposed to running the traces in parallel with the noisy trace.
- Place the external components as close to the device as possible, as shown in Figure 45. Keeping  $R_F$  and  $R_G$  close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring may significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 12.5 Trademarks

E2E is a trademark of Texas Instruments.

Bluetooth is a registered trademark of Bluetooth SIG, Inc.

All other trademarks are the property of their respective owners.

### 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-220.

## THERMAL PAD MECHANICAL DATA

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View
