

16-BIT, 1-MSPS, PSEUDO-BIPOLAR DIFFERENTIAL SAR ADC WITH ON-CHIP ADC DRIVER (OPA) AND 4-CHANNEL DIFFERENTIAL MULTIPLEXER

Check for Samples: [ADS8254](#)

FEATURES

- 1.0-MHz Sample Rate, Zero Latency at Full Speed
- 16-Bit Resolution
- Supports Pseudo-Bipolar Differential Input Range: -4 V to +4 V with 2-V Common-Mode
- Built-In Four Channel, Differential Ended Multiplexer; with Channel Count Selection and Auto/Manual Mode
- On-Board Differential ADC Driver (OPA)
- Buffered Reference Output to Level Shift Bipolar ± 4 -V Input with External Resistance Divider
- Reference/2 Output to Set Common-Mode for External Signal Conditioner
- 16-/8-Bit Parallel Interface
- SNR: 95.4dB Typ at 2-kHz I/P
- THD: -118dB Typ at 2-kHz I/P
- Power Dissipation: 331.25 mW at 1 MSPS
- Internal Reference
- Internal Reference Buffer
- 64-Pin QFN Package

APPLICATIONS

- Medical Imaging/CT Scanners
- Automated Test Equipment
- High-Speed Data Acquisition Systems
- High-Speed Closed-Loop Systems

DESCRIPTION

The ADS8254 is a high-performance analog system-on-chip (SoC) device with an 16-bit, 1-MSPS A/D converter, 4-V internal reference, an on-chip ADC driver (OPA), and a 4-channel differential multiplexer. The channel count of the multiplexer and auto/manual scan modes of the device are user selectable.

The ADC driver is designed to leverage the very high noise performance of the differential ADC at optimum power usage levels.

The ADS8254 outputs a buffered reference signal for level shifting of a ± 4 -V bipolar signal with an external resistance divider. A $V_{ref}/2$ output signal is available to set the common-mode of a signal conditioning circuit. The device also includes an 16-/8-bit parallel interface.

The ADS8254 is available in a 9 mm x 9 mm, 64-pin QFN package and is characterized from -40°C to 85°C.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PIN ASSIGNMENTS

PIN FUNCTIONS

PIN		I/O	DESCRIPTION
NO	NAME		
MULTIPLEXER INPUT PINS			
17	CH0P	I	Non-inverting analog input for differential multiplexer channel number 0. Device performance is optimized for 50 ohm source impedance at this input.
18	CH0M	I	Inverting analog input for differential multiplexer channel number 0. Device performance is optimized for 50 ohm source impedance at this input.
19	CH1P	I	Non-inverting analog input for differential multiplexer channel number 1. Device performance is optimized for 50 ohm source impedance at this input.
20	CH1M	I	Inverting analog input for differential multiplexer channel number 1. Device performance is optimized for 50 ohm source impedance at this input.
29	CH2P	I	Non-inverting analog input for differential multiplexer channel number 2. Device performance is optimized for 50 ohm source impedance at this input.
30	CH2M	I	Inverting analog input for differential multiplexer channel number 2. Device performance is optimized for 50 ohm source impedance at this input.
31	CH3P	I	Non-inverting analog input for differential multiplexer channel number 3. Device performance is optimized for 50 ohm source impedance at this input.
32	CH3M	I	Inverting analog input for differential multiplexer channel number 3. Device performance is optimized for 50 ohm source impedance at this input.
ADC INPUT PINS			
25	INP	I	ADC Non inverting input., connect 1nF cap across INP and INM
27	INM	I	ADC Inverting input, connect 1nF cap across INP and INM
REFERENCE INPUT/ OUTPUT PINS			
8, 9	REFM	I	Reference ground.
10	REFIN	I	Reference Input. Add 0.1-μF decoupling capacitor between REFIN and REFM.
11	REFOUT	O	Reference Output. Add 1-μF capacitor between the REFOUT pin and REFM pin when internal reference is used.

SLAS643A – MARCH 2009 – REVISED JANUARY 2014

www.ti.com**PIN FUNCTIONS (continued)**

PIN		I/O	DESCRIPTION		
NO	NAME				
14	VCMO	O	This pin outputs Refin/2 and can be used to set common-mode voltage of differential analog inputs.		
15	BUF-REF	O	Buffered reference output. Useful to level shift bipolar signals using external resistors.		
POWER CONTROL PINS					
21	PD-RBUF	I	High on this pin powers down the reference buffer (BUF-REF).		
MULTIPLEXER CONTROL PINS					
33	AUTO	I	High level on this pin selects 'Auto' mode for multiplexer scanning. Low level selects manual mode of multiplexer scanning		
34	C3	I	In auto mode (AUTO=1) multiplexer channel selection is reset to CH0 on rising edge of MXCLK while C3=1. The pin is 'do not care' in manual mode.		
35	C2	I	Acts as multiplexer address bit when AUTO=0 (Manual mode). In auto mode (AUTO=1) C2 and C1 select the last multiplexer channel (channel count) in the auto scan sequence.		
36	C1	I	Acts as multiplexer address LSB when AUTO=0 (Manual mode). In auto mode (AUTO=1) C2 and C1 select the last multiplexer channel (channel count) in the auto scan sequence.

DEVICE OPERATION AND TIMING DIAGRAMS

The ADS8254 is analog system-on-chip (SoC) device. The device includes a multiplexer, a single-ended input/differential output ADC driver and differential input high-performance ADC, an additional internal reference, a buffered reference output, and a REF/2 output.

Figure 1 shows the basic operation of the device (including all elements). Subsequent sections describe the detailed timings of the individual blocks of the device (primarily the multiplexer and ADC).

Figure 1. Device Operation

As shown in the diagram, the device can be controlled with only one ($\overline{\text{CONVST}}$) digital input. On the falling edge of $\overline{\text{CONVST}}$, the BUSY output of the device goes high. A high level on BUSY indicates the device has sampled the signal and it is converting the sample into its digital equivalent. After the conversion is complete, the BUSY output falls to a logic low level and the device output data corresponding to the recently converted sample is available for reading.

It is recommended (not mandatory) to short the BUSY output of the device to the MXCLK input. The device selects a new channel at every rising edge of MXCLK . The multiplexer is differential. The multiplexer and ADC driver are designed to settle to the 18-bit level before sampling; even at the maximum conversion speed.

ADC Control and Timing: The timing diagrams in this section describe ADC operation; multiplexer operation is described in the following sections.

Multiplexer: The multiplexer has two modes of sequencing namely auto sequencing and manual sequencing. Multiplexer mode selection and operation is controlled with the AUTO, C1, C2, C3, and MXCLK pins.

Auto Sequencing: A logic one level on the AUTO pin selects auto sequencing mode. It is possible to select the number of channels to be scanned (always starting from channel zero) in auto sequencing mode. Pins C1 and C2 select the channel count (last channel in the auto sequence).

On every rising edge of MXCLK while C3 is at the logic zero level, the next higher channel (in ascending order) is selected. Channel selection rolls over to channel zero on the rising edge of MXCLK after channel selection reaches the *channel count* (last channel in the auto sequence selected by pins C1 and C2).

Any time during the sequence the channel sequence can be reset to channel zero. A rising edge on MXCLK while C3 is at the logic one level resets channel selection to channel zero.

Table 1. Channel Selection in Auto Mode

CHANNEL COUNT PINS			CLOCK PIN	LAST CHANNEL IN SEQUENCE	CHANNEL SEQUENCE
C3	C2	C1	MXCLK		
0	0	0	↑	0	0,0,0,0..
0	0	1	↑	1	0,1,0,1,..
0	1	0	↑	2	0,1,2,0,1,2,0...
0	1	1	↑	3	0,1,2,3,0,1,2,3,0...
1	X	X	↑	X	n → 0 (channel reset to zero)

**Figure 7. Multiplexer Auto Mode Timing Diagram**

Manual Sequencing: A logic zero level on the AUTO pin selects manual sequencing mode. Pins C1 and C2 set the channel address. On the rising edge of MXCLK, the addressed channel is connected to the ADC driver input.

Table 2. Channel Selection in Manual Mode

APPLICATION INFORMATION

As discussed before, the ADS8254 is 16-bit analog SoC that includes various blocks like a multiplexer, ADC driver, internal reference, internal reference buffer, buffered reference output, and Ref/2 output on-board. The following diagram shows the recommended analog and digital interfacing of the ADS8254.

APPLICATION DIAGRAM

Figure 69. Analog and Digital Interface Diagram

As shown in [Figure 69](#), the ADS8254 accepts unipolar differential analog inputs in the range of $\pm V_{ref}$ with a common-mode voltage of $V_{ref}/2$. An application may require the interfacing of bipolar input signals. The following diagram shows the conversion of bipolar input signals to unipolar differential signals.

ADS8254

SLAS643A – MARCH 2009 – REVISED JANUARY 2014

www.ti.com

Figure 70. Bipolar Input Signals to Unipolar Differential Signals Conversion

MICROCONTROLLER INTERFACING

ADS8254 to 8-Bit Microcontroller Interface

Figure 71 shows a parallel interface between the ADS8254 and a typical microcontroller using an 8-bit data bus. The BUSY signal is used as a falling edge interrupt to the microcontroller.

Figure 71. ADS8254 Application Circuitry

Figure 72. ADS8254 Using Internal Reference

ADS8254

SLAS643A – MARCH 2009 – REVISED JANUARY 2014

www.ti.com

PRINCIPLES OF OPERATION

The ADS8254 features a high-speed successive approximation register (SAR) analog-to-digital converter (ADC). The architecture is based on charge redistribution which inherently includes a sample/hold function. See [Figure 71](#) for the application circuit for the ADS8254.

The conversion clock is generated internally. The conversion time of 650 ns is capable of sustaining a 1 MHz throughput.

When a conversion is initiated, the differential input on these pins is sampled on the internal capacitor array. While a conversion is in progress, both inputs are disconnected from any internal function.

REFERENCE

The ADS8254 can operate with an external reference with a range from 3.0 V to 4.2 V. The reference voltage on the input pin 10 (REFIN) of the converter is internally buffered. A clean, low noise, well-decoupled reference voltage on this pin is required to ensure good performance of the converter. A low noise band-gap reference like the REF5040 can be used to drive this pin. A 0.1- μ F decoupling capacitor is required between REFIN and REFM pins (pin 10 and pin 9) of the converter. This capacitor should be placed as close as possible to the pins of the device. Designers should strive to minimize the routing length of the traces that connect the terminals of the capacitor to the pins of the converter. An RC network can also be used to filter the reference voltage. A 100- Ω series resistor and a 0.1- μ F capacitor, which can also serve as the decoupling capacitor can be used to filter the reference voltage.

Figure 73. ADS8254 Using External Reference

The ADS8254 also has limited low pass filtering capability built into the converter. The equivalent circuitry on the REFIN input is as shown in [Figure 74](#).

Figure 74. Simplified Reference Input Circuit

The REFM input of the ADS8254 should always be shorted to AGND. A 4.096-V internal reference is included. When the internal reference is used, pin 11 (REFOUT) is connected to pin 10 (REFIN) with an 0.1- μ F decoupling capacitor and 1- μ F storage capacitor between pin 11 (REFOUT) and pin 9 (REFM) (see [Figure 72](#)). The internal reference of the converter is double buffered. If an external reference is used, the second buffer provides isolation between the external reference and the CDAC. This buffer is also used to recharge all of the capacitors of the CDAC during conversion. Pin 11 (REFOUT) can be left unconnected (floating) if external reference is used (as shown in [Figure 74](#)).

ANALOG INPUT

The ADS8254 features an analog multiplexer, a differential, high-input impedance, unity-gain ADC driver, and a high-performance ADC. Typically it would require a lot of care in the selection of the driving circuit components and board layout for high resolution ADC driving. However, an on-board ADC driver simplifies the job for the user. All that is needed is to decouple AINP and AINM with a 1-nF decoupling capacitor across these two terminals as close to the device as possible. The multiplexer inputs tolerate a source impedance of up to 50 Ω for the specified device performance at a 1-MSPS operating speed. This relaxes the constraints on the signal conditioning circuit. In the case of true bipolar input signals, it is possible to condition them with a resistor divider as shown in Figure 70. The device permits use of 1.2-k Ω resistors for the divider with an effective source impedance of 600 Ω for signal BW less than 10 kHz. A suitable capacitor value can be used to limit signal BW which limits noise coming from the resistor divider network. Care must be taken about absolute analog voltage at the multiplexer input terminals. This voltage should not exceed VCC and VEE. The clamp at driver OPA limits the voltage applied to the ADC input.

Reading Data

The ADS8254 outputs full parallel data in straight binary format as shown in Table 3. The parallel output is active when CS and RD are both low. There is a minimal quiet zone requirement around the falling edge of CONVST. This is 50 ns prior to the falling edge of CONVST and 40 ns after the falling edge. No data read should be attempted within this zone. Any other combination of CS and RD sets the parallel output to 3-state. BYTE is used for multiword read operations. BYTE is used whenever lower bits on the bus are output on the higher byte of the bus. Refer to Table 3 for ideal output codes.

Table 3. Ideal Input Voltages and Output Codes

DESCRIPTION	ANALOG VALUE	DIGITAL OUTPUT STRAIGHT BINARY	
		BINARY CODE	HEX CODE
Full scale range	$2 \times (+V_{ref})$		
Least significant bit (LSB)	$2 \times (+V_{ref})/65536$		
+Full scale	$(+V_{ref}) - 1 \text{ LSB}$	0111 1111 1111 1111	7FFF
Midscale	0 V	0000 0000 0000 0000	0000
Midscale – 1 LSB	0 V – 1 LSB	1111 1111 1111 1111	FFFF
Zero	$-V_{ref}$	1000 0000 0000 0000	8000

The output data is a full 16-bit word (D15–D0) on DB15–DB0 pins (MSB–LSB) if BYTE is low.

The result may also be read on an 8-bit bus for convenience. This is done by using only pins DB15–DB8. In this case two reads are necessary: the first as before, leaving BYTE low and reading the 8 most significant bits on pins DB15–DB8, then bringing BYTE high, the low bits (D7–D0) appear on pins DB15–DB8.

This multiword read operation can be performed with multiple active $\overline{RD}$ (toggling) or with $\overline{RD}$ held low for simplicity. This is referred to as the AUTO READ operation.

Table 4. Conversion Data Read Out

BYTE	DATA READ OUT	
	PINS DB15–DB8	PINS DB7–DB0
High	D7–D0	All One's
Low	D15–D8	D7–D0

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS8254IBRGCR	NRND	VQFN	RGC	64	2000	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	ADS8254 B	
ADS8254IBRGCT	NRND	VQFN	RGC	64	250	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	ADS8254 B	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
