DESCRIPTION

The SY100S331 offers three D-type, edge-triggered master/slave flip-flops with true and complement outputs, designed for use in high-performance ECL systems. Each flip-flop is controlled by a common clock (CP_c), as well as its own clock pulse (CP_n). The resultant clock signal controlling the flip-flop is the logical OR operation of these two clock signals. Data enters the master when both CP_c and CP_n are LOW and enters the slave on the rising edge of either CP_c or CP_n (or both).

Additional control signals include Master Set (MS) and Master Reset (MR) inputs. Each flip-flop also has its own Direct Set (SD_n) and Direct Clear (CD_n) signals. The MR, MS, SD_n and DC_n signals override the clock signals. The inputs on this device have 75kΩ pull-down resistors.
