

# ADC128D818 12-Bit, 8-Channel, ADC System Monitor With Temperature Sensor, Internal – External Reference, and I<sup>2</sup>C Interface

## 1 Features

- 12-Bit Resolution Delta-Sigma ADC
- Local Temperature Sensing
- Configurable Single-Ended and/or Pseudo-Diff. Inputs
- 2.56-V Internal VREF or Variable External VREF
- WATCHDOG Window Comparators with Status and Mask Registers of All Measured Values
- Independent Registers for Storing Measured Values
- $\overline{\text{INT}}$  Output Notifies Microprocessor of Error Event
- I<sup>2</sup>C Serial Bus Interface Compatibility
- 9 Selectable Addresses
- TIME-OUT Reset Function to Prevent I<sup>2</sup>C Bus Lock-Up
- Individual Channel Shutdown to Limit Power Consumption
- Deep Shutdown Mode to Minimize Power Consumption
- TSSOP 16-Lead Package
- Key Specifications
  - ADC Resolution 12-Bit
  - Supply Voltage Range 3 V to 5.5 V
  - Total Unadjusted Error  $-0.45\%/+0.2\%$
  - Integral Non-Linearity  $\pm 1$  LSB
  - Differential Non-Linearity  $\pm 1$  LSB
  - Operating Current 0.56 mA
  - Deep Shutdown Current 10  $\mu$ A
  - Temperature Resolution  $^{\circ}\text{C}/\text{LSb}$
  - Temperature Accuracy ( $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ )  $\pm 3^{\circ}\text{C}$

– Temperature Accuracy ( $-25^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ )  $\pm 2^{\circ}\text{C}$

## 2 Applications

- Communications Infrastructure
- Thermal and Hardware Server Monitors
- System Monitors
- Industrial and Medical Systems
- Electronic Test Equipment and Instrumentation
- Power Supply Monitoring and Supervision

## 3 Description

The ADC128D818 I<sup>2</sup>C system monitor is designed for maximum flexibility. The system monitor can be configured for single-ended and/or pseudo-differential inputs. An onboard temperature sensor, combined with WATCHDOG window comparators, and an interrupt output pin,  $\overline{\text{INT}}$ , allow easy monitoring and out-of-range alarms for every channel. A high performance internal reference is also available to provide for a complete solution in the most difficult operating conditions.

The ADC128D818's 12-bit delta-sigma ADC supports Standard Mode (Sm, 100 kbps) and Fast Mode (Fm, 400 kbps) I<sup>2</sup>C interfaces. The ADC128D818 includes a sequencer to control channel conversions and stores all converted results in independent registers for easy microprocessor retrieval. Unused channels can be shut down independently to conserve power.

### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE    | BODY SIZE (NOM)   |
|-------------|------------|-------------------|
| ADC128D818  | TSSOP (16) | 5.00 mm × 4.40 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Description (continued)

The ADC can use either an internal 2.56-V reference or a variable external reference. An analog filter is included on the I<sup>2</sup>C digital control lines to provide improved noise immunity. The device also includes a TIME-OUT reset function on SDA and SCL to prevent I<sup>2</sup>C bus lock-up.

The ADC128D818 operates from 3-V to 5.5-V power supply voltage range, –40°C to 125°C temperature range, and the device is available in a 16-pin TSSOP package.

| 14  | IN2  |                                                                                   |               |                                                                                                                                                           |
| 15  | IN1  |                                                                                   |               |                                                                                                                                                           |
| 16  | IN0  |                                                                                   |               |                                                                                                                                                           |

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)(2)(3)</sup>  $\text{AEC}^{(4)}$

|                                                                  | MIN  | MAX                    | UNIT |
|------------------------------------------------------------------|------|------------------------|------|
| Supply Voltage (V+)                                              | 6.0  | 6                      | V    |
| Voltage on SCL, SDA, A0, A1, $\overline{\text{INT}}$             | −0.3 | 6                      | V    |
| Voltage on IN0-IN7, VREF                                         | −0.3 | (V <sup>+</sup> + 0.3) | V    |
| Input Current at Any Pin <sup>(5)</sup>                          |      | ±5                     | mA   |
| Package Input Current <sup>(5)</sup>                             |      | ±30                    | mA   |
| Maximum Junction Temperature (T <sub>JMAX</sub> ) <sup>(6)</sup> |      | 150                    | °C   |
| Storage Temperature, T <sub>stg</sub>                            | −65  | 150                    | °C   |

- (1) All voltages are measured with respect to GND, unless otherwise specified.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (4) For soldering specifications, [SNOA549](#)
- (5) If the input voltage at any pin exceeds the power supply (that is, VIN < GND or VIN > V<sup>+</sup>) but is less than the absolute maximum ratings, then the current at that pin must be limited to 5 mA. The 30 mA maximum package input current rating limits the number of pins that can safely exceed the power supply with an input current of 5 mA to six pins. Parasitic components and/or ESD protection circuitry are shown in the Pin Descriptions table.
- (6) The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>JMAX</sub>, R<sub>θJA</sub> and the ambient temperature, T<sub>A</sub>. The maximum allowable power dissipation at any temperature is P<sub>D</sub> = (T<sub>JMAX</sub> − T<sub>A</sub>) / R<sub>θJA</sub>.

### 7.2 ESD Ratings

|                                            |                                                                                | VALUE | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±3000 | V    |
|                                            | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±1000 |      |
|                                            | Machine model                                                                  | ±300  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## ADC128D818

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted<sup>(1)</sup>)

|                                                      | MIN   | MAX                     | UNIT |
|------------------------------------------------------|-------|-------------------------|------|
| Supply Voltage (V+)                                  | 3     | 5.5                     | V    |
| Voltage on SCL, SDA, A0, A1, $\overline{\text{INT}}$ | –0.05 | 5.5                     | V    |
| Voltage on IN0-IN7, VREF                             | –0.05 | (V <sup>+</sup> + 0.05) | V    |
| Temperature Range for Electrical Characteristics     | –40   | 125                     | °C   |
| Operating Temperature                                | –40   | 125                     | °C   |

(1) All voltages are measured with respect to GND, unless otherwise specified.

### 7.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup>                           | ADC128D818 | UNIT |
|---------------------------------------------------------|------------|------|
|                                                         | PW (TSSOP) |      |
|                                                         | 16 PINS    |      |
| R <sub>θJA</sub> Junction-to-ambient thermal resistance | 130        | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

### 7.5 DC Electrical Characteristics

The following specifications apply for 3 V<sub>DC</sub> ≤ V<sup>+</sup> ≤ 5.5 V<sub>DC</sub>, External VREF = 2.56 V, unless otherwise specified. All limits T<sub>A</sub> = T<sub>J</sub> = 25°C unless otherwise specified<sup>(1)</sup>.

| PARAMETER                                        |                                                | TEST CONDITIONS                                                        |                                                                        | MIN <sup>(2)</sup> | TYP <sup>(3)</sup> | MAX <sup>(2)</sup> | UNIT |
|--------------------------------------------------|------------------------------------------------|------------------------------------------------------------------------|------------------------------------------------------------------------|--------------------|--------------------|--------------------|------|
| POWER SUPPLY CHARACTERISTICS                     |                                                |                                                                        |                                                                        |                    |                    |                    |      |
| V <sup>+</sup> Supply Voltage                    |                                                |                                                                        |                                                                        | 3.3 or 5           |                    | V                  |      |
|                                                  |                                                | T <sub>A</sub> = T <sub>J</sub> = T <sub>MIN</sub> to T <sub>MAX</sub> |                                                                        | 3                  | 5.5                |                    |      |
| VREF                                             | External Reference Voltage                     |                                                                        |                                                                        | 2.56               |                    | V                  |      |

(1) Each input and output is protected by an ESD structure to GND, as shown in the . Input voltage magnitude up to 0.3 V above V<sup>+</sup> or 0.3 V below GND will not damage the ADC128D818. There are diodes that exist between some inputs and the power supply rails. Errors in the ADC conversion can occur if these diodes are forward biased by more than 50 mV. As an example, if V<sup>+</sup> is 4.5 V<sub>DC</sub>, IN<sub>x</sub> (where 0 ≤ x ≤ 7) must be ≤ 4.55 V<sub>DC</sub> to ensure accurate conversions.

(2) Limits are ensured to AOQL (Average Outgoing Quality Level).

(3) Typicals are at T<sub>J</sub> = T<sub>A</sub> = 25°C and represent most likely parametric normal.

(4) Limit is specified by characterization.

## DC Electrical Characteristics (continued)

The following specifications apply for  $3\text{ V}_{\text{DC}} \leq V^+ \leq 5.5\text{ V}_{\text{DC}}$ , External VREF = 2.56 V, unless otherwise specified. All limits  $T_A = T_J = 25^\circ\text{C}$  unless otherwise specified<sup>(1)</sup>.

## 8 Detailed Description

### 8.1 Overview

The ADC128D818 provides 8 analog inputs, a temperature sensor, a delta-sigma ADC, an external or internal VREF option, and WATCHDOG registers on a single chip. An I<sup>2</sup>C Serial Bus interface is also provided. The ADC128D818 can perform voltage and temperature monitoring for a variety of systems.

The ADC128D818 continuously converts the voltage input to 12-bit resolution with an internal VREF of 0.625-mV LSb (Least Significant bit) weighting, yielding input range of 0 V to 2.56 V. There is also an external VREF option that ranges from 1.25 V to V+. The analog inputs are intended to be connected to several power supplies present in a variety of systems. Eight inputs can be configured for single-ended and/or pseudo-differential channels. Temperature can be converted to a 9-bit two's complement word with resolutions of 0.5°C per LSb.

The ADC128D818 provides a number of internal registers. These registers are summarized in [Table 19](#).

The ADC128D818 supports Standard Mode (Sm, 100 kbps) and Fast Mode (Fm, 400 kbps) I<sup>2</sup>C interface modes of operation. ADC128D818 includes an analog filter on the I<sup>2</sup>C digital control lines that allows improved noise immunity. The device also supports TIME-OUT reset function on SDA and SCL to prevent I<sup>2</sup>C bus lock-up. Two tri-level address pins allow up to 9 devices on a single I<sup>2</sup>C bus.

At start-up, ADC128D818 cycles through each measurement in sequence and continuously loops through the sequence based on the Conversion Rate Register (address 07h) setting. Each measured value is compared to values stored in the Limit Registers (addresses 2Ah - 39h). When the measured value violates the programmed limit, the ADC128D818 will set a corresponding interrupt bit in the Interrupt Status Registers (address 01h). An interrupt output pin, INT, is also available and fully programmable.

### 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Supply Voltage (V+)

The ADC128D818 operates with a supply voltage, V+, that has a range between 3 V to 5.5 V. Take care to bypass this pin with a parallel combination of 1-μF (electrolytic or tantalum) capacitor and 0.1-μF (ceramic) bypass capacitor.

### 8.3.2 Voltage References (VREF)

The reference voltage (VREF) sets the analog input range. The ADC128D818 has two options for setting VREF. The first option is to use the internal VREF, which is equal to 2.56 V. The second option is to source VREF externally through pin 1 of ADC128D818. In this case, the external VREF will operate in the range of 1.25 V to V+. The default VREF selection is the internal VREF. If the external VREF is preferred, use the [Advanced Configuration Register — Address 0Bh](#) to change this setting.

VREF source must have a low output impedance and needs to be bypassed with a minimum capacitor value of 0.1 μF. A larger capacitor value of 1 μF placed in parallel with the 0.1 μF is preferred. VREF of the ADC128D818, like all ADC converters, does not reject noise or voltage variations. Keep this in mind if VREF is derived from the power supply. Any noise and/or ripple from the supply that is not rejected by the external reference circuitry will appear in the digital results. The use of a reference source is recommended. The LM4040 and LM4050 shunt reference families as well as the LM4120 and LM4140 series reference families are excellent choices for a reference source.

### 8.3.3 Analog Inputs (IN0 - IN7)

The ADC128D818 allows up to 8 single-ended inputs or 4 pseudo-differential inputs as selected by the modes of operation. The input types are described in the next subsections.

#### 8.3.3.1 Single-Ended Input

ADC128D818 allows a maximum of 8 single-ended inputs, where the source's voltage is connected to INx ( $0 \leq x \leq 7$ ). The source's ground must be connected to ADC128D818's GND pin. In theory, INx can be of any value between 0V and  $(VREF - 3LSb/2)$ , where  $LSb = VREF/2^{12}$ .

To use the device single-endedly, refer to the [Modes of Operation](#) section and to bits [2:1] of the [Advanced Configuration Register — Address 0Bh](#). [Figure 24](#) shows the appropriate configuration for a single-ended connection.

**Figure 24. Single-Ended Configuration**

#### 8.3.3.2 Pseudo-Differential Input

Pseudo-differential mode is defined as the positive input voltage applied differentially to the ADC128D818, as shown in [Figure 25](#). The input that is digitized is  $(\Delta VIN = IN+ - IN-)$ , where  $(IN+ - IN-)$  is  $(IN0 - IN1)$ ,  $(IN3 - IN2)$ ,  $(IN4 - IN5)$ , or  $(IN7 - IN6)$ . Be aware of this input configuration because the order is swapped. In theory,  $\Delta VIN$  can be of any value between 0 V and  $(VREF - 3LSb/2)$ , where  $LSb = VREF/2^{12}$ .

By using this pseudo-differential input, small signals common to both inputs are rejected. Thus, operation with a pseudo-differential input signal will provide better performance than with a single-ended input. See [Modes of Operation](#) for more information.

## Feature Description (continued)

**Figure 25. Pseudo-Differential Configuration**

## 8.4 Device Functional Modes

### 8.4.1 Modes of Operation

ADC128D818 allows 4 modes of operation, as summarized in the following table. Set the desired mode of operation using the [Advanced Configuration Register — Address 0Bh](#), bits [2:1]).

**Table 1. Modes of Operation**

| CH.           | MODE 0            | MODE 1 | MODE 2                 | MODE 3                 |
|---------------|-------------------|--------|------------------------|------------------------|
| 1             | IN0               | IN0    | IN0 (+) and<br>IN1 (-) | IN0                    |
| 2             | IN1               | IN1    | IN3 (+) and<br>IN2 (-) | IN1                    |
| 3             | IN2               | IN2    | IN4 (+) and<br>IN5 (-) | IN2                    |
| 4             | IN3               | IN3    | IN7 (+) and<br>IN6 (-) | IN3                    |
| 5             | IN4               | IN4    |                        | IN4 (+) and<br>IN5 (-) |
| 6             | IN5               | IN5    |                        | IN7 (+) and<br>IN6 (-) |
| 7             | IN6               | IN6    |                        |                        |
| 8             | nc <sup>(1)</sup> | IN7    |                        |                        |
| Local<br>Temp | Yes               | No     | Yes                    | Yes                    |

(1) nc = No Connect

## 8.5 Programming

### 8.5.1 Interface

The Serial Bus control lines include the SDA (serial data), SCL (serial clock), and A0-A1 (Serial Bus Address) pins. The ADC128D818 can only operate as a slave. The SCL line only controls the serial interface, and all of other clock functions within ADC128D818 are done with a separate asynchronous internal clock.

When the Serial Bus Interface is used, a write will always consists of the ADC128D818 Serial Bus Address byte, followed by the Register Address byte, then the Data byte. [Figure 26](#) and [Figure 27](#) are two examples showing how to write to the ADC128D818.

There are two cases for a read:

1. If the Register Address is known to be at the desired address, simply read the ADC128D818 with the Serial Bus Address byte, followed by the Data byte read from the ADC128D818. Examples of this type of read can be seen in [Figure 28](#) and [Figure 29](#).
2. If the Register Address value is unknown, write to the ADC128D818 with the Serial Bus Address byte, followed by the desired Register Address byte. Then restart the Serial Communication with a Read consisting of the Serial Bus Address byte, followed by the Data byte read from the ADC128D818. See [Figure 30](#) and [Figure 31](#) for examples of this type of read.

## Programming (continued)

The Serial Bus Address can be found in the next section, and the Register Address can be found in [Register Maps](#). For more information on the I<sup>2</sup>C Interface, refer to NXP's "I<sup>2</sup>C-Bus Specification and User Manual", rev. 03.

### 8.5.1.1 Serial Bus Address

There are nine different configurations for the ADC128D818 Serial Bus Address, thus nine devices are allowed on a single I<sup>2</sup>C bus. Examples to set each address bit low, high, or to midscale can be found in [System Examples](#). The Serial Bus Address can be set as follows:

**Table 2. Serial Bus Address Table**

| A1   | A0   | SERIAL BUS ADDRESS<br>[A6][A5][A4]...[A0] | SERIAL BUS ADDRESS (HEX) |
|------|------|-------------------------------------------|--------------------------|
| LOW  | LOW  | 001_1101b                                 | 1Dh                      |
| LOW  | MID  | 001_1110b                                 | 1Eh                      |
| LOW  | HIGH | 001_1111b                                 | 1Fh                      |
| MID  | LOW  | 010_1101b                                 | 2Dh                      |
| MID  | MID  | 010_1110b                                 | 2Eh                      |
| MID  | HIGH | 010_1111b                                 | 2Fh                      |
| HIGH | LOW  | 011_0101b                                 | 35h                      |
| HIGH | MID  | 011_0110b                                 | 36h                      |
| HIGH | HIGH | 011_0111b                                 | 37h                      |

### 8.5.1.2 Time-out

The ADC128D818 I<sup>2</sup>C state machine resets to its idle state if either SCL or SDA is held low for longer than 35 ms. This feature also ensures that ADC128D818 will automatically release SDA after driving it low continuously for 25 to 35 ms, hence preventing I<sup>2</sup>C bus lock-up. The TIME-OUT feature should not be used when the device is operating in deep shutdown mode.

### 8.6.5 Conversion Rate Register — Address 07h

Default Value [7:0] = 0000\_0000 binary

**Table 7. Address 07h**

| BIT | BIT NAME        | READ/WRITE | BIT DESCRIPTION                                                                                                                                                                                                                                                    |
|-----|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0   | Conversion Rate | Read/Write | Controls the conversion rate:<br>0: Low Power Conversion Mode<br>1: Continuous Conversion Mode<br>Note: This register must only be programmed when the device is in shutdown mode, that is, when the 'START' bit of the 'Configuration Register' (address 00h) = 0 |
| 1–7 | Reserved        | Read Only  |                                                                                                                                                                                                                                                                    |

### 8.6.6 Channel Disable Register — Address 08h

Default Value [7:0] = 0000\_0000 binary

- This register must only be programmed when the device is in shutdown mode, that is, when the 'START' bit of the "Configuration Register" (address 00h) = 0.
- Whenever this register is programmed, all of the values in the Channel Reading Registers and Interrupt Status Registers will return to their default values.

**Table 8. Address 08h**

| BIT           | BIT NAME    | READ/WRITE | BIT DESCRIPTION                                                                                                 |

### 8.6.13 Manufacturer ID Register — Address 3Eh

Default Value [7:0] = 0000\_0001 binary

**Table 14. Address 3Eh**

| ADDRESS | REGISTER NAME   | READ/WRITE | REGISTER DESCRIPTION                            |
|---------|-----------------|------------|-------------------------------------------------|
| 3Eh     | Manufacturer ID | Read Only  | Manufacturer's ID always defaults to 0000_0001. |

### 8.6.14 Revision ID Register — Addresses 3Fh

Default Value [7:0] = 0000\_1001 binary

**Table 15. Addresses 3Fh**

| ADDRESS | REGISTER NAME | READ/WRITE | REGISTER DESCRIPTION                        |
|---------|---------------|------------|---------------------------------------------|
| 3Fh     | Revision ID   | Read Only  | Revision's ID always defaults to 0000_1001. |

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

#### 9.1.1 Digital Output (D<sub>OUT</sub>)

The digital output code for a 12-bit ADC can be calculated as:

$$D_{OUT} = [\Delta V_{IN} / V_{REF}] \times 2^{12} \quad (1)$$

For Equation 1,  $\Delta V_{IN} = IN_x - GND$ , where  $0 \leq x \leq 7$ , for the single-ended configuration, and  $\Delta V_{IN} = (IN_+ - IN_-)$  for the pseudo-differential configuration. In theory,  $\Delta V_{IN}$  can be of any value between 0 V and  $(V_{REF} - 3LSb/2)$ . Any  $\Delta V_{IN}$  value outside of this range will produce a digital output code of 0 or 4095. Figure 32 shows a theoretical plot of D<sub>OUT</sub> vs.  $\Delta V_{IN}$  and some sample D<sub>OUT</sub> calculation using Equation 1.

**Figure 32. D<sub>OUT</sub> vs  $\Delta V_{IN}$  for a 12-Bit ADC Assuming  $V_{REF} = 2.56$  V.**

#### 9.1.2 Temperature Measurement System

The ADC128D818 delta- $V_{BE}$  type temperature sensor and delta-sigma ADC perform 9-bit two's-complement conversions of the temperature. This temperature reading can be obtained at the Temperature Reading Register (address 27h). This register is 16-bit wide, and thus, all 9 bits of the temperature reading can be read using a double byte read (Figure 29 or Figure 31). The following Figure 33 and Figure 33 show the theoretical output code (D<sub>OUT</sub>) vs. temperature and some typical temperature-to-code conversions.

## Application Information (continued)

(Non-Linear Scale for Clarity)

**Figure 33. 9-Bit Temperature-to-Digital Transfer Function**

**Table 16. Temperature Registers Sample Temperatures**

| TEMP   | DIGITAL OUTPUT (D <sub>OUT</sub> ) |         |      |
|--------|------------------------------------|---------|------|
|        | BINARY [MSb...LSb]                 | DECIMAL | HEX  |
| +125°C | 0_1111_1010                        | 250     | 0_FA |
| +25°C  | 0_0011_0010                        | 50      | 0_32 |
| +0.5°C | 0_0000_0001                        | 1       | 0_01 |
| +0°C   | 0_0000_0000                        | 0       | 0_00 |
| -0.5°C | 1_1111_1111                        | 511     | 1_FF |
| -25°C  | 1_1100_1110                        | 462     | 1_CE |
| -40°C  | 1_1011_0000                        | 432     | 1_B0 |

In general, the easiest way to calculate the temperature (°C) is to use the following formulas:

$$\text{If } D_{OUT}[\text{MSb}] = 0: + \text{Temp}(^{\circ}\text{C}) = D_{OUT}(\text{dec}) / 2 \quad (2)$$

$$\text{If } D_{OUT}[\text{MSb}] = 1: - \text{Temp}(^{\circ}\text{C}) = [2^9 - D_{OUT}(\text{dec})] / 2 \quad (3)$$

### 9.1.2.1 Temperature Limits

One of the ADC128D818 features is monitoring the temperature reading. This monitoring is accomplished by setting a temperature limit to the Temperature High Limit Register (T<sub>hot</sub>, address 38h) and Temperature Hysteresis Limit Register (T<sub>hot\_hyst</sub>, address 39h). When the temperature reading > T<sub>hot</sub>, an interrupt occurs. How this interrupt occurs will be explained in [Temperature Interrupt](#).

Each temperature limit is represented by an 8-bit, two's complement word with a least significant bit (LSb) equal to 1°C. [Table 17](#) shows some sample temperatures that can be programmed to the Temperature Limit Registers.

In general, use the following equations to calculate the digital code that represents the desired temperature limit:

$$\text{If Temp Limit } (^{\circ}\text{C}) \geq 0: \text{Digital Code (dec)} = \text{Temp Limit}(^{\circ}\text{C}) \quad (4)$$

$$\text{If Temp Limit } (^{\circ}\text{C}) < 0: \text{Digital Code (dec)} = 2^8 - |\text{Temp Limit}(^{\circ}\text{C})| \quad (5)$$

**Table 17. Temperature Limit Registers Sample Temperatures**

| TEMP LIMIT | DIGITAL CODE       |         |     |
|------------|--------------------|---------|-----|
|            | BINARY [MSb...LSb] | DECIMAL | HEX |
| +125°C     | 0111_1101          | 125     | 7D  |
| +25°C      | 0001_1001          | 25      | 19  |
| +1.0°C     | 0000_0001          | 1       | 01  |
| +0°C       | 0000_0000          | 0       | 00  |
| -1.0°C     | 1111_1111          | 255     | FF  |
| -25°C      | 1110_1111          | 231     | E7  |
| -40°C      | 1101_1000          | 216     | D8  |

### 9.1.3 Interrupt Structure

**Figure 34. Interrupt Structure**

Figure 34 shows the ADC128D818's Interrupt Structure.

#### NOTE

The number next to each bit name represents its register address and bit number. For example, 'INT\_Clear' (00h[3]) refers to bit 3 of register address 00h.

#### 9.1.3.1 Interrupt Output ( $\overline{\text{INT}}$ )

ADC128D818 generates an interrupt as a result of each of its internal WATCHDOG registers on the voltage and temperature channels. In general,  $\overline{\text{INT}}$  becomes active when all three scenarios, as depicted in Figure 34, occur:

1. ' $\overline{\text{INT}}$ \_Clear' (00h[3]) = 0.
2. ' $\overline{\text{INT}}$ \_Enable' (00h[1]) = 1 to enable interrupt output.
3. The voltage reading > the voltage high limit or  $\leq$  the voltage low limit, or the temperature reading >  $T_{\text{hot}}$ .

#### 9.1.3.2 Interrupt Clearing

Reading the Interrupt Status Register (addresses 01h) will output the contents of the register and clear the register. When the Interrupt Status Register clears, the interrupt output pin,  $\overline{\text{INT}}$ , also clears until this register is updated by the round-robin monitoring loop.

Another method to clear the interrupt output pin,  $\overline{\text{INT}}$ , is setting ' $\overline{\text{INT}}$ \_Clear' bit (address 00h, bit 3) = 1. When this bit is high, the ADC128D818 round-robin monitoring loop will stop.

### 9.1.3.3 Temperature Interrupt

One of the ADC128D818 features is monitoring the temperature reading. This monitoring is accomplished by setting a temperature limit to the Temperature High Limit Register ( $T_{hot}$ , address 38h) and Temperature Hysteresis Limit Register ( $T_{hot\_hyst}$ , address 39h). These limit registers have an interrupt mode, shown in Figure 35, that operates in the following way: if the temperature reading  $> T_{hot}$ , an interrupt will occur and will remain active indefinitely until reset by reading the Interrupt Status Register (address 01h) or cleared by the 'INT\_Clear' bit.

Once an interrupt event has occurred by crossing  $T_{hot}$ , then reset, an interrupt will occur again once the next temperature conversion has completed. The interrupts will continue to occur in this manner until the temperature reading is  $\leq T_{hot\_hyst}$  and a read of the Interrupt Status Register has occurred.

**Figure 35. Temperature Response Structure**  
(Assuming the Interrupt Output Pin, INT, is Reset Before the Next Temperature Reading)

## 9.2 Typical Application

**Figure 36. Hardware Monitor Application**

### 9.2.1 Design Requirements

In this typical hardware monitor application, several different sources are being monitored by the ADC128D818. First, an external temperature sensor (LM94022) is being monitored. An external temperature sensor is frequently used to monitor ambient temperature of the system.

## Typical Application (continued)

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Power Management

To understand the average supply current ( $I^+$ ), the conversion rates must be introduced. ADC128D818 has three types of conversion rates: Continuous Conversion Mode, Low Power Conversion Mode, and One Shot Mode. In the Low Power Conversion Mode, the device converts all of the enabled channels then enters shutdown mode; this process takes approximately 728 ms to complete. (More information on the conversion rate will be discussed in the [Conversion Rate Register — Address 07h](#) and [One-Shot Register — Address 09h](#) sections).

Each type of conversion produces a different average supply current. The supply current for a voltage conversion will be referred to as  $I^+_{\text{VOLTAGE}}$ , a temperature conversion as  $I^+_{\text{TEMP}}$ , and the shutdown mode as  $I^+_{\text{SHUTDOWN}}$ . These values can be obtained from Typical Performance Characteristics plots.

In general,  $I^+$  is the average supply current while ADC128D818 is operating in the Low Power Conversion Mode with all of the available channels enabled. Its plot can be seen in [Typical Characteristics](#) and its equation, [Equation 6](#).

$$I^+ = [(0.0168)(b)(I^+_{\text{VOLTAGE}})] + [(4.932)(10^{-3})(a)(I^+_{\text{TEMP}})] \\ + [1 - (4.932)(10^{-3})(a) - 0.0168(b)](I^+_{\text{SHUTDOWN}})$$

where

- a is the number of local temperature available.
  - b is the number of ENABLED voltage channel.
- (6)

Each mode of operation has a different "a" and "b" values. The following table shows the value for "a" and the maximum value for "b" for each mode.

**Table 18. "A" and "B" Values**

|        | a | b (MAX) |
|--------|---|---------|
| Mode 0 | 1 | 7       |
| Mode 1 | 0 | 8       |
| Mode 2 | 1 | 4       |
| Mode 3 | 1 | 6       |

#### 9.2.2.2 Using the ADC128D818

**Table 19. ADC128D818 Internal Registers**

| REGISTER NAME                   | READ/<br>WRITE | REGISTER<br>ADDRESS<br>(HEX) | DEFAULT<br>VALUE [7:0] | REGISTER DESCRIPTION                                                   | REGISTER<br>FORMAT |
|---------------------------------|----------------|------------------------------|------------------------|------------------------------------------------------------------------|--------------------|
| Configuration Register          | R/W            | 00h                          | 0000_1000              | Provides control and configuration                                     | 8-bit              |
| Interrupt Status Register       | R              | 01h                          | 0000_0000              | Provides status of each WATCHDOG limit or interrupt event              | 8-bit              |
| Interrupt Mask Register         | R/W            | 03h                          | 0000_0000              | Masks the interrupt status from propagating to $\overline{\text{INT}}$ | 8-bit              |
| Conversion Rate Register        | R/W            | 07h                          | 0000_0000              | Controls the conversion rate                                           | 8-bit              |
| Channel Disable Register        | R/W            | 08h                          | 0000_0000              | Disables conversion for each voltage or temperature channel            | 8-bit              |
| One-Shot Register               | W              | 09h                          | 0000_0000              | Initiates a single conversion of all enabled channels                  | 8-bit              |
| Deep Shutdown Register          | R/W            | 0Ah                          | 0000_0000              | Enables deep shutdown mode                                             | 8-bit              |
| Advanced Configuration Register | R/W            | 0Bh                          | 0000_0000              | Selects internal or external VREF and modes of operation               | 8-bit              |
| Busy Status Register            | R              | 0Ch                          | 0000_0010              | Reflects the ADC128D818 'Busy' and 'Not Ready' statuses                | 8-bit              |
| Channel Readings Registers      | R              | 20h - 27h                    | - - -                  | Report channels (voltage or temperature) readings                      | 16-bit             |

**Table 19. ADC128D818 Internal Registers (continued)**

| REGISTER NAME            | READ/<br>WRITE | REGISTER<br>ADDRESS<br>(HEX) | DEFAULT<br>VALUE [7:0] | REGISTER DESCRIPTION                                    | REGISTER<br>FORMAT |

| Manufacturer ID Register | R              | 3Eh                          | 0000_0001              | Reports the manufacturer's ID                           | 8-bit              |
| Revision ID Register     | R              | 3Fh                          | 0000_1001              | Reports the revision's ID                               | 8-bit              |

#### 9.2.2.2.1 Quick Start

1. Power on the device, then wait for at least 33ms.
2. Read the Busy Status Register (address 0Ch). If the 'Not Ready' bit = 1, then increase the wait time until 'Not Ready' bit = 0 before proceeding to the next step.
3. Program the [Advanced Configuration Register — Address 0Bh](#):
  - a. Choose to use the internal or external VREF (bit 0).
  - b. Choose the mode of operation (bits [2:1]).
4. Program the Conversion Rate Register (address 07h).
5. Choose to enable or disable the channels using the Channel Disable Register (address 08h).
6. Using the Interrupt Mask Register (address 03h), choose to mask or not to mask the interrupt status from propagating to the interrupt output pin,  $\overline{\text{INT}}$ .
7. Program the Limit Registers (addresses 2Ah – 39h).
8. Set the 'START' bit of the Configuration Register (address 00h, bit 0) to 1.
9. Set the ' $\overline{\text{INT}}$ \_Clear' bit (address 00h, bit 3) to 0. If needed, program the ' $\overline{\text{INT}}$ \_Enable' bit (address 00h, bit 1) to 1 to enable the  $\overline{\text{INT}}$  output.

The ADC128D818 then performs a round-robin monitoring of enabled voltage and temperature channels. The sequence of items being monitored corresponds to locations in the Channel Readings Registers (except for the temperature reading). Detailed descriptions of the register map can be found at the end of this data sheet.

#### 9.2.2.2.2 Poweron Reset (POR)

When power is first applied, the ADC128D818 performs a power on reset (POR) on several of its registers, which sets the registers to their default values. These default values are shown in [Table 19](#) or in [Register Maps](#).

Registers whose default values are not shown have power on conditions that are indeterminate.

#### 9.2.2.2.3 Configuration Register (address 00h)

The Configuration Register (address 00h) provides all control to the ADC128D818. After POR, the 'START' bit (bit 0) is set low and the ' $\overline{\text{INT}}$ \_Clear' bit (bit 3) is set high.

The Configuration Register has the ability to start and stop the ADC128D818, enable and disable the  $\overline{\text{INT}}$  output, and set the registers to their default values.

- Bit 0, 'START', controls the monitoring loop of the ADC128D818. After POR, set this bit high to start conversion. Setting this bit low stops the ADC128D818 monitoring loop and puts the ADC128D818 in shutdown mode; thus, reducing power consumption. Even though this bit is set low, serial bus communication is possible with any register in the ADC128D818.
  - After an interrupt occurs, the  $\overline{\text{INT}}$  pin will not be cleared if the user sets this bit low.
- Bit 1, ' $\overline{\text{INT}}$ \_Enable', enables the interrupt output pin,  $\overline{\text{INT}}$ , when this bit is set high.
- Bit 3, ' $\overline{\text{INT}}$ \_Clear', clears the interrupt output pin,  $\overline{\text{INT}}$ , when this bit is set high. When this bit is set high, the ADC128D818 monitoring function will stop. The content of the Interrupt Status Register (address 01h) will not be affected.
- Bit 7, 'INITIALIZATION', accomplishes the same function as POR, that is, it initializes some of the registers to their default values. This bit automatically clears after being set high. Setting this bit high, however, does not reset the Channel Readings Registers (addresses 20h - 27h) and the Limit Registers (addresses 2Ah - 39h). These registers will be indeterminate immediately after power on. If the Channel Readings Registers contain valid conversion results and/or the Limit Registers have been previously set, they will not be affected by this

bit.

#### 9.2.2.2.4 Interrupt Status Register (address 01h)

Each bit in this read-only register indicates whether the voltage reading  $>$  the voltage high limit or  $\leq$  the voltage low limit, or the temperature reading  $>$  the temperature high limit. For example, if "IN0 High Limit" register (address 2Ah) were set to 2 V and if IN0 reading (address 20h) were 2.56 V, then bit 'IN0 Error' would be 1, indicating that the voltage high limit has been exceeded.

#### 9.2.2.2.5 Interrupt Mask Register (address 03h)

This register masks the interrupt status from propagating to the interrupt output pin,  $\overline{\text{INT}}$ . For example, if bit 'IN0 Mask' = 1, then the interrupt output pin,  $\overline{\text{INT}}$ , would not be pulled low even if an error event occurs at IN0.

#### 9.2.2.2.6 Conversion Rate Register (address 07h)

There are three options for controlling the conversion rate. The first option is called the Low Power Conversion Mode, where the device converts all of the enabled channels then enters shutdown mode. This process takes approximately 728 ms to complete.

The second option is the Continuous Conversion Mode, where the device continuously converts the enabled channels, thus never entering shutdown mode. A voltage conversion takes 12.2 ms, and a temperature conversion takes 3.6 ms. For example, if operating in mode 2 and three voltage channels were enabled, then each round-robin monitor would take 40.2 ms ( $3 \times 12.2\text{ms} + 3.6\text{ms}$ ) to complete. Use the "Channel Disable Register" (address 08h) to disable the desired channel(s).

The third option is called the ON-Shot mode, which will be discussed in the next subsection.

#### 9.2.2.2.7 One-Shot Register (address 09h)

The One-Shot register is used to initiate a single conversion and comparison cycle when the device is in shutdown mode or deep shutdown mode, after which the device returns to the respective mode it was in. The obvious advantage of using this mode is lower power consumption because the device is operating in shutdown or deep shutdown mode.

This register is not a data register, and it is the write operation that causes the one-shot conversion. The data written to this address is irrelevant and is not stored. A zero will always be read from this register.

#### 9.2.2.2.8 Deep Shutdown Register (address 0Ah)

The ADC128D818 can be placed in deep shutdown mode, thus reducing more power consumption. The procedures for deep shutdown entrance are:

1. Enter shutdown by setting the 'START' bit of the "Configuration Register" (address 00h, bit 0) to 0.
2. Enter deep shutdown by setting the 'DEEP SHUTDOWN' bit (address 0Ah, bit 0) to 1.
3. A one-shot conversion can be triggered by writing any values to register address 09h.

Deep Shutdown Exit Procedure:

1. Set the 'DEEP SHUTDOWN' bit to 0.

#### 9.2.2.2.9 Channel Readings Registers (addresses 20h - 27h)

The channel conversion readings are available in registers 20h to 27h. Each register is 16-bit wide to accommodate the 12-bit voltage reading or 9-bit temperature reading. Conversions can be read at any time and will provide the result of the last conversion. If a conversion is in progress while a communication is started, that conversion will be completed, and the Channel Reading Registers will not be updated until the communication is complete.

### 9.2.3 Application Curve

Figure 37. Total Unadjusted Error

## 9.3 System Examples

### 9.3.1 General Voltage Monitoring

Figure 38. Typical Analog Input Application

A typical application for ADC128D818 is voltage monitoring. In this application, the inputs would most often be connected to linear power supplies of 2.5-V, 3.3-V, ±5-V and ±12-V inputs. These inputs must be attenuated with external resistors to any desired value within the input range. The attenuation is done with resistors R1 and R2 for the positive single-ended voltage, and R3 and R4 for the positive pseudo-differential voltage.

A typical single-ended application might select the input voltage divider to provide 1.9 V at the analog input of the ADC128D818. This is sufficiently high for good resolution of the voltage, yet leaves headroom for upward excursions from the supply of about 25%. To simplify the process of resistor selection, set the value of R2 first. Select a value for R2 between 10 kΩ and 100 kΩ. This is low enough to avoid errors due to input leakage currents yet high enough to protect both the inputs under and overdrive conditions as well as minimize loading of the source. Finally, calculate R1 to provide a 1.9-V input using simple voltage divider derived formula:

$$R1 = [(VS1 - VIN2) / VIN2] \times R2 \quad (7)$$

## ADC128D818

SNAS483F – FEBRUARY 2010 – REVISED AUGUST 2015

www.ti.com

### System Examples (continued)

Take care to bypass V+ with decoupling 0.1- $\mu$ F ceramic capacitor and 1- $\mu$ F tantalum capacitor. If using the external reference option, VREF must be connected to a voltage reference, such as the LM4140, and must also be decoupled to the ground plane by a 0.1- $\mu$ F ceramic capacitor and a 1- $\mu$ F tantalum capacitor. For both supplies, the 0.1- $\mu$ F capacitor must be located as close as possible to the ADC128D818.

Since SDA, SCL, and  $\overline{\text{INT}}$  are open-drain pins, they must have external pullup resistors to ensure that the bus is pulled high until a master device or slave device sinks enough current to pull the bus low. A typical pullup resistor, R, ranges from 1.1 k $\Omega$  to 10 k $\Omega$ . Refer to NXP's "I<sup>2</sup>C-Bus Specification and User Manual" for more information on sizing R.

Because there are two tri-level address pins (A0 and A1), up to 9 devices can share the same I<sup>2</sup>C bus. A trick to set these serial addresses uses four GPO (general purpose output) pins from the master device as shown in the example diagram. Table 20 shows how to program these GPO pins.

**Table 20. Setting Serial Bus Address Using GPO**

| A1   | A0   | GPO1 | GPO2 | GPO3 | GPO4 |
|------|------|------|------|------|------|
| LOW  | LOW  | Z    | LOW  | Z    | LOW  |
| LOW  | MID  | Z    | LOW  | HIGH | LOW  |
| LOW  | HIGH | Z    | LOW  | HIGH | Z    |
| MID  | LOW  | HIGH | LOW  | Z    | LOW  |
| MID  | MID  | HIGH | LOW  | HIGH | LOW  |
| MID  | HIGH | HIGH | LOW  | HIGH | Z    |
| HIGH | LOW  | HIGH | Z    | Z    | LOW  |
| HIGH | MID  | HIGH | Z    | HIGH | LOW  |
| HIGH | HIGH | HIGH | Z    | HIGH | Z    |

### 9.3.2 Voltage Monitoring for Power Supplies

**Figure 39. Power Supply Application**

Figure 39 shows a more complete systems application using a DC–DC converter. Such configuration can be used in a power supply application. The point to make with this example diagram is the Serial Bus Address connections. The previous example shows A0 and A1 connected to four GPOs, but this example shows a simpler A0 and A1 connection using two resistor dividers. This connection accomplishes the same goal as the GPO connection, that is, it can set A0 and A1 high, low, or to midscale.

### 9.3.3 Temperature Sensors

### Figure 40. Temperature Sensor Applications

According to the LM94022 data sheet ([SNIS140](#)), the voltage-to-temperature output plot can be determined using the method of linear approximation as follows:

$$V - V_1 = (V_2 - V_1) / (T_2 - T_1) \times (T - T_1)$$

- $V$  is in mV
- $T$  is in  $^{\circ}\text{C}$
- $V_1$  and  $T_1$  are the coordinates of the lowest temperature
- and  $T_2$  and  $V_2$  are the coordinates of the highest temperature.

(8)

$$V - 925 \text{ mV} = (760 \text{ mV} - 925 \text{ mV}) / (50^\circ\text{C} - 20^\circ\text{C}) \times (T - 20^\circ\text{C}) \quad (9)$$

$$V = (-5.50 \text{ mV /}^\circ\text{C}) \times T + 1035 \text{ mV} \quad (10)$$

For more information and explanation of this example, refer to the LM94022 ([SNIS140](#)) data sheet.

### 9.3.4 Bridge Sensors

**Figure 41. Bridge Sensor Application**

ADC128D818 is perfect for transducer applications such as pressure sensors. These sensors measure pressure of gases or liquids and produce a pressure-equivalent voltage at their outputs. [Figure 41](#) shows a typical connection of a pressure sensor, represented by the bridge sensor.

Most pressure sensor has a low sensitivity characteristic, which means its output is typically in the millivolts range. Because of that reason, an op-amp, such as an instrumentation amplifier, can be used for the gain stage.

The positive aspect of this configuration is its ratiometric connection. A ratiometric connection is when the ADC's VREF and GND are connected to the bridge sensor's voltage references. With a ratiometric configuration, external VREF accuracy can be ignored.

## 10 Power Supply Recommendations

The ADC128D818 operates with a supply voltage, V+, that has a range between 3 V to 5.5 V. Take care to bypass this pin with a parallel combination of 1-μF (electrolytic or tantalum) capacitor and 0.1-μF (ceramic) bypass capacitor.

The reference voltage (VREF) sets the analog input range. The ADC128D818 has two options for setting VREF. The first option is to use the internal VREF, which is equal to 2.56 V. The second option is to source VREF externally through pin 1 of ADC128D818. In this case, the external VREF will operate in the range of 1.25 V to V+. The default VREF selection is the internal VREF. If the external VREF is preferred, use the [Advanced Configuration Register — Address 0Bh](#) to change this setting.

VREF source must have a low output impedance and needs to be bypassed with a minimum capacitor value of 0.1 μF. A larger capacitor value of 1 μF placed in parallel with the 0.1 μF is preferred. VREF of the ADC128D818, like all ADC converters, does not reject noise or voltage variations. Keep this in mind if VREF is derived from the power supply. Any noise and/or ripple from the supply that is not rejected by the external reference circuitry will appear in the digital results. The use of a reference source is recommended. The LM4040 ([SLOS746](#)) and LM4050 ([SNOS455](#)) shunt reference families as well as the LM4120 ([SNVS049](#)) and LM4140 ([SNVS053](#)) series reference families are excellent choices for a reference source.

## 11 Layout

### 11.1 Layout Guidelines

Analog inputs will provide best accuracy when referred to the GND pin or a supply with low noise. A separate, low-impedance ground plane for analog ground, which provides a ground point for the voltage dividers and analog components, will provide best performance but is not mandatory. Analog components such as voltage dividers must be located physically as close as possible to the ADC128D818.

### 11.2 Layout Example

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. | ADC128D818CIMTX/NOPB | TSSOP        | PW              | 16   | 2500 | 330.0              | 12.4               | 6.95    | 5.6     | 1.6     | 8.0     | 12.0   | Q1            |

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

| Device                   | Package Type | Package Drawing | Pins | SPQ  | Length (mm) | Width (mm) | Height (mm) |
|--------------------------|--------------|-----------------|------|------|-------------|------------|-------------|
| ADC128D818CIMTX/NOP<br>B | TSSOP        | PW              | 16   | 2500 | 367.0       | 367.0      | 35.0        |

4220204/A 02/2017

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

# EXAMPLE BOARD LAYOUT

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 10X

4220204/A 02/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE: 10X

4220204/A 02/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER
