

# FXPS7550D4

## Digital absolute pressure sensor, 20 to 550 kPa

**Rev. 5 — 15 July 2019** **Product data sheet**

## 1 General description

The FXPS7550D4 high-performance, high-precision barometric absolute pressure (BAP) sensor consists of a compact capacitive micro-electro-mechanical systems (MEMS) device coupled with a digital integrated circuit (IC) producing a fully calibrated digital output.

The sensor is based on NXP's high-precision capacitive pressure cell technology. The architecture benefits from redundant pressure transducers as an expanded quality measure. This sensor delivers highly accurate pressure and temperature readings through either a serial peripheral interface (SPI) or an inter-integrated circuit ($I^2C$) interface. The FXPS7550D4 uses either a 3.3 V or 5.0 V power supply. Furthermore, the sensor employs an on-demand digital self-test for the digital IC and the MEMS transducers.

The sensor operates over a pressure range of 20 kPa to 550 kPa and over a wide temperature range of −40 ºC to 130 ºC.

The sensor comes in an industry-leading 4 mm x 4 mm x 1.98 mm, restriction of hazardous substances (RoHS) compliant, high power quad flat no lead (HQFN) package[1] suitable for small PCB integration. Its AEC-Q100[2] compliance, high accuracy, reliable performance and high media resistivity make it ideal for use in automotive, industrial, and consumer applications.

## 2 Features and benefits

- Absolute pressure range: 20 to 550 kPa
- Operating temperature range: –40 °C to 130 °C
- Pressure transducer and digital signal processor (DSP)
  - Digital self test
- $I^2C$ compatible serial interface
  - Slave mode operation
  - Standard mode, fast mode, and fast-mode plus support
- 32-bit SPI compatible serial interface
  - Sensor data transmission commands
    - 12-bit data for absolute pressure
    - 8-bit data for temperature
    - 2-bit basic status and 2-bit detailed status fields
    - 3, 4, or 8-bit configurable CRC
- Capacitance to voltage converter with anti-aliasing filter
- Sigma delta ADC plus sinc filter
- 800 Hz or 1000 Hz low-pass filter for absolute pressure
- Lead-free, 16-pin HQFN, 4 mm x 4 mm x 1.98 mm package

# 3 Applications

## 3.1 Automotive

- Engine management digital BAP
- Small engine control

## 3.2 Industrial

- Compressed air
- Manufacturing line control
- Gas metering
- Weather stations

## 3.3 Medical/Consumer

- Blood pressure monitor
- Medicine dispensing systems
- White goods

# 4 Ordering information

**Table 1. Ordering information**

| Type number | Package | | |
|---|---|---|---|
| | Name | Description | Version |
| FXPS7550DI4<br>FXPS7550DS4 | HQFN16 | HQFN16, plastic, thermal enhanced quad flat pack; no leads; 16 terminals; 0.8 mm pitch; 4 mm x 4 mm x 1.98 mm body | SOT1573-1 |

## 4.1 Ordering options

**Table 2. Ordering options**

| Device | Range [kPa] | Packing | Interface | Temperature range |
|---|---|---|---|---|
| FXPS7550DI4T1 | 20 to 550 kPa | Tape and reel | $I^2C$ | -40 °C to 130 °C |
| FXPS7550DS4T1 | 20 to 550 kPa | Tape and reel | SPI | –40 °C to 130 °C |

## 6.2 Pin description

**Table 3. Pin description**

| Pin | Pin name | Description |
|---|---|---|
| 3 | INT | Interrupt output<br>The output can be configured to be active low or active high. If unused, NXP recommends pin 3 be unterminated. Optionally, pin 3 can be tied to $V_{SS}$. |
| 1, 16 | $V_{CC}$ | Power supply |
| 4, 15 | $V_{SS}$ | Supply return (ground) |
| 2, 5, 12 | TESTx | Test pin<br>NXP recommends pins 2, 5, and 12 be unterminated. Optionally, these pins can be tied to $V_{SS}$ |
| 6, 7, 14 | NC | No connect |
| 8 | SS_B | Slave / Device select<br>In $I^2C$ mode, input pin 8 must be connected to $V_{CC}$ with an external pull-up resistor, as shown in the application diagram.<br>In SPI mode, input pin 8 provides the slave select for the SPI port. An internal pull-up device is connected to this pin. |
| 9 | SCLK/SCL | In $I^2C$ mode, input pin 9 provides the serial clock. This pin must be connected to $V_{CC}$ with an external pull-up resistor, as shown in the application diagram.<br>In SPI mode, input pin 9 provides the serial clock. An internal pull-down device is connected to this pin. |
| 10 | MOSI | SPI data in<br>In SPI mode, pin 10 functions as the serial data input to the SPI port. An internal pull-down device is connected to this pin. |
| 11 | MISO/SDA | SPI/$I^2C$ data out<br>In $I^2C$ mode, pin 11 functions as the serial data input/output. Pin 11 must be connected to $V_{CC}$ with an external pull-up resistor, as shown in the application diagram.<br>In SPI mode, pin 11 functions as the serial data output. |
| 13 | $V_{CCIO}$ | I/O supply<br>Pin 13 must be connected to $V_{CC}$, the device supply. |
| 17 | PAD | Die attach pad<br>Pin 17 is the die attach flag, and must be connected to $V_{SS}$. |

# 7 Functional description

## 7.1 Voltage regulators

The device derives its internal supply voltage from the $V_{CC}$ and $V_{SS}$ pins. An external filter capacitor is required for $V_{CC}$, as shown in Figure 23 and Figure 24.

A reference generator provides a reference voltage for the ΣΔ converter.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

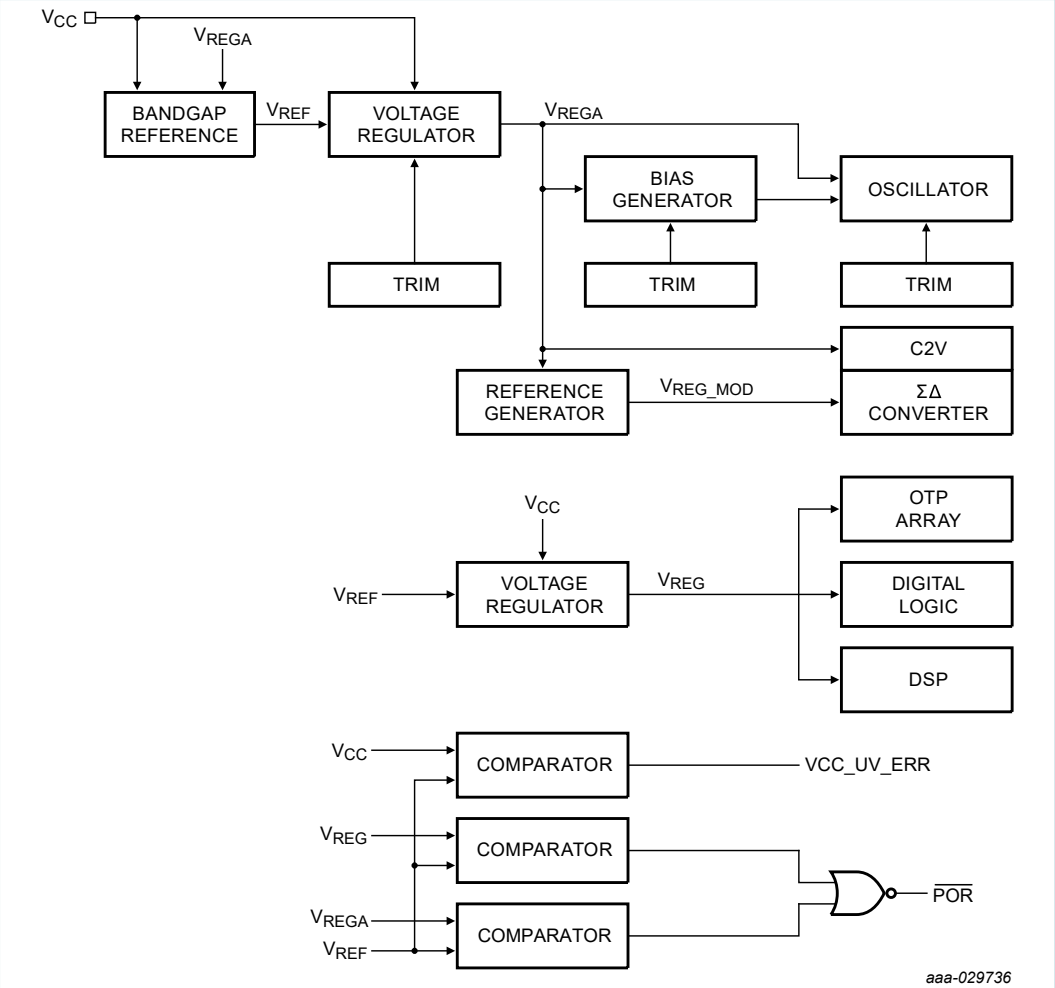

**Figure 3. Voltage regulation and monitoring**

### 7.1.1 $V_{CC}$, $V_{REG}$, $V_{REGA}$, undervoltage monitor

A circuit is incorporated to monitor the $V_{CC}$ supply voltage and the internally regulated voltages $V_{REG}$ and $V_{REGA}$. If any of the voltages fall below the specified undervoltage thresholds in Table 100, SPI and $I^2C$ transactions are terminated. Once the supply returns above the threshold, the device resumes responses.

## 7.2 Internal oscillator

The device includes a factory trimmed oscillator as specified in Table 101.

## 7.3 Pressure sensor signal path

### 7.3.1 Transducer

See Table 100 and Table 101 for transducer parameters.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.3.2 Self-test functions

The device includes analog and digital self-test functions to verify the functionality of the transducer and the signal chain. The self-test functions are selected by writing to the ST_CTRL[3:0] bits in the DSP_CFG_U1 register. The ST_CTRL bits select the desired self-test connection.

Once the ENDINIT bit is set, the ST_CTRL bits are forced to '0000'. Future writes to the ST_CTRL bits are disabled until a device reset.

#### 7.3.2.1 $P_{ABS}$ common mode verification

When the $P_{ABS}$ common mode self-test is selected, the ST_ACTIVE bit is set, the ST_ERROR is cleared and the device begins an internal measurement of the common mode signal of the P-cells and compares the result against a predetermined limit. If the result exceeds the limit, the ST_ERROR bit is set. The $P_{ABS}$ common mode self-test repeats continuously every $t_{ST_INIT}$ when the ST_CTRL bits are set to the specified value. Once the test is disabled, the ST_ERROR bit updates with the final test result within $t_{ST_INIT}$ of disabling the test. The ST_ACTIVE bit remains set until the final test result is reported. Figure 4 is an example of a user-controlled self-test procedure.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

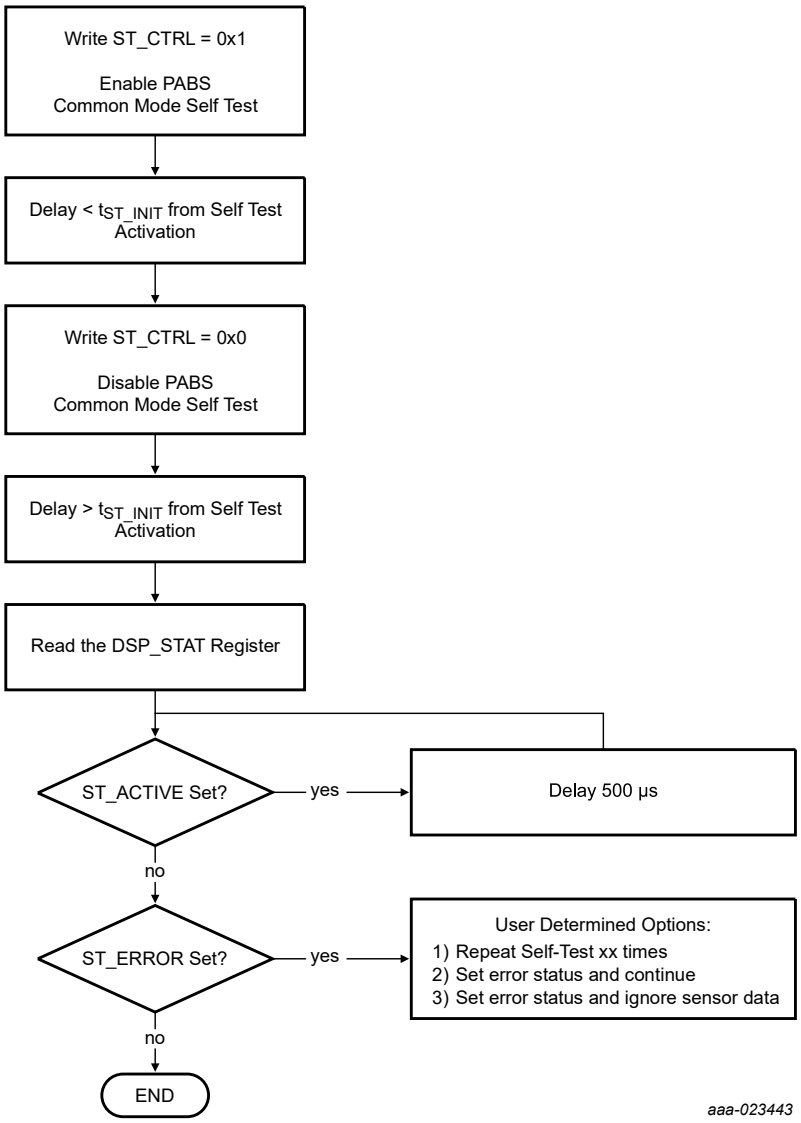

**Figure 4. User-controlled $P_{ABS}$ common mode self-test flowchart**

### 7.3.2.2 Startup digital self-test verification

Four unique fixed values can be forced at the output of the sinc filter by writing to the ST_CTRL bits as shown in Table 4. The digital self-test values result in a constant value at the output of the signal chain. After a specified period of time the SNS_DATAx register value can be verified against the specified values in the table below. The values listed below are for the $P_{ABS}$ signal. When any of these self-test functions are selected, the ST_ACTIVE bit is set. These signals can only be selected when the ENDINIT bit is not set.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

**Table 4. Self-test control register**

| ST_CTRL[3] | ST_CTRL[2] | ST_CTRL[1] | ST_CTRL[0] | Function | SNS_DATAx register contents |
|---|---|---|---|---|---|
| 1 | 1 | 0 | 0 | Digital self-test #1 | 8171h |
| 1 | 1 | 0 | 1 | Digital self-test #2 | 6C95h |
| 1 | 1 | 1 | 0 | Digital self-test #3 | 807Ah |
| 1 | 1 | 1 | 1 | Digital self-test #4 | 78ACh |

#### 7.3.2.3 Startup sense data fixed value verification

Four unique fixed values can be forced to the SNS_DATAX_x registers by writing to the ST_CTRL bits as shown in Table 5. When any of these values are selected, the ST_ACTIVE bit is set. These signals can only be selected when the ENDINIT bit is not set.

**Table 5. Self-test control bits for sense data fixed value verification**

| ST_CTRL[3] | ST_CTRL[2] | ST_CTRL[1] | ST_CTRL[0] | Function | SNS_DATAx register contents |
|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | DSP write to SNS_DATAx_X registers inhibited. | 0000h |
| 0 | 1 | 0 | 1 | DSP write to SNS_DATAx_X registers inhibited. | AAAAh |
| 0 | 1 | 1 | 0 | DSP write to SNS_DATAx_X registers inhibited. | 5555h |
| 0 | 1 | 1 | 1 | DSP write to SNS_DATAx_X registers inhibited. | FFFFh |

### 7.3.3 ΣΔ converter

A second order sigma delta modulator converts the voltage from the analog front end to a data stream that is input to the DSP. A simplified block diagram is shown in Figure 5.

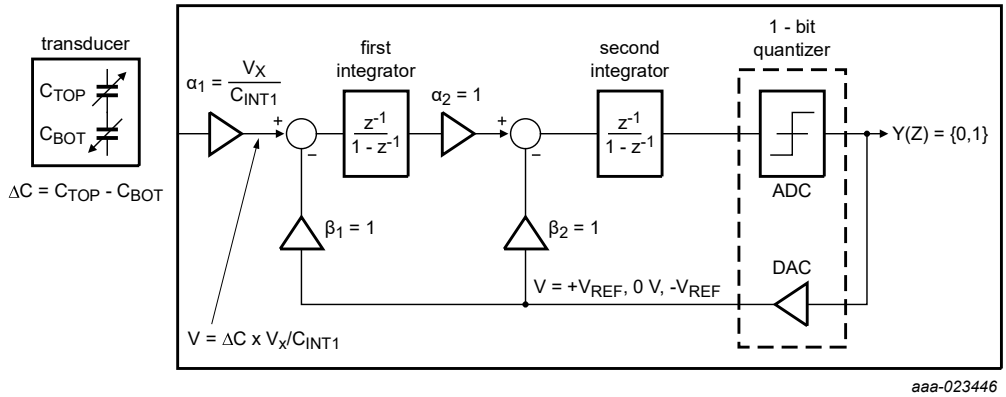

**Figure 5. ΣΔ converter block diagram**

The sigma delta modulator operates at a frequency of 1 MHz, with the transfer function in Equation 1.

$$H(Z) = \frac{\alpha_1}{Z^2} \quad (1)$$

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.3.4 Digital signal processor (DSP)

A DSP is used to perform signal filtering and compensation. A diagram illustrating the signal processing flow within the DSP is shown in Figure 6.

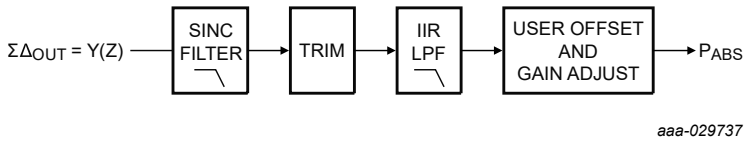

**Figure 6. Signal chain diagram**

#### 7.3.4.1 Decimation sinc filter

In Equation 2, the output of the ΣΔ modulator is decimated and converted to a parallel value by two third-order sinc filters; the first with a decimation ratio of 24 and the second with a decimation ratio of 4.

$$H(Z) = \left(\frac{1}{24^3}\right) \times \left(\frac{1 - Z^{-24}}{1 - Z^{-1}}\right)^3 \quad H(Z) = \left(\frac{1}{4^3}\right) \times \left(\frac{1 - Z^{-4}}{1 - Z^{-1}}\right)^3 \tag{2}$$

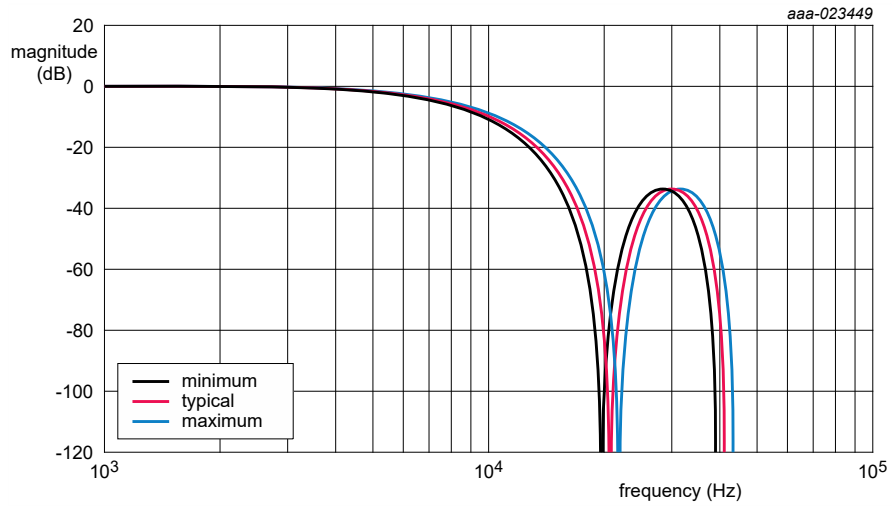

**Figure 7. Sinc filter response**

#### 7.3.4.2 Signal trim and compensation

The device includes digital trim to compensate for sensor offset, sensitivity, and nonlinearity over temperature.

#### 7.3.4.3 Low-pass filter

Data from the sinc filter is processed by an infinite impulse response (IIR) low-pass filter with the transfer function and coefficients shown in Equation 3.

$$H(Z) = a_0 \times \frac{(n_{11} \times z^0) + (n_{12} \times z^{-1}) + (n_{13} \times z^{-2})}{(d_{11} \times z^0) + (d_{12} \times z^{-1}) + (d_{13} \times z^{-2})} \times \frac{(n_{21} \times z^0) + (n_{22} \times z^{-1}) + (n_{23} \times z^{-2})}{(d_{21} \times z^0) + (d_{22} \times z^{-1}) + (d_{23} \times z^{-2})} \tag{3}$$

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

**Table 6. IIR low pass filter coefficients**

| Filter number | Typical –3 dB frequency | Filter order | Filter coefficients (24 bit) | | | | Group delay (µs) | Typical attenuation @ 1000 Hz (dB) |
|---|---|---|---|---|---|---|---|---|
| 1 | 800 Hz | 4 | $a_0$ | 0.088642612609670 | — | — | 418 | 4.95 |

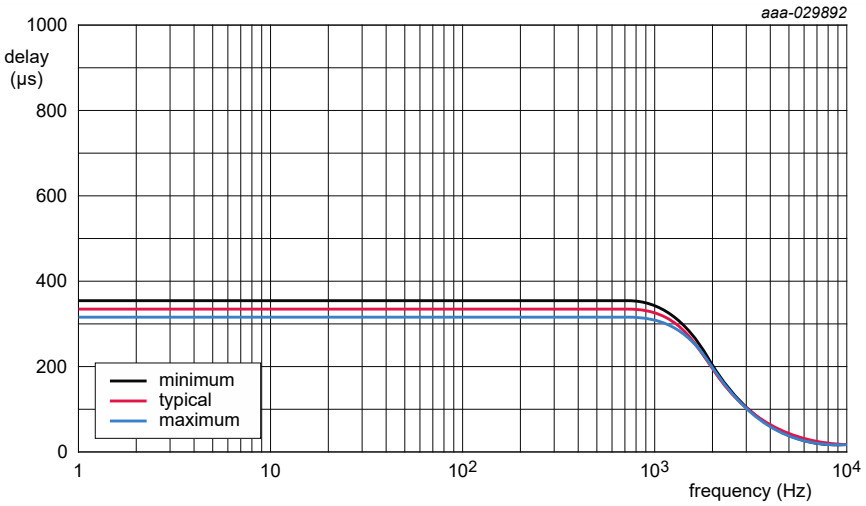

**Figure 11. 1000 Hz, 4-pole output signal delay**

#### 7.3.4.4 Absolute pressure output data scaling equation

Equation 4 is used to convert absolute pressure readings with the variables as specified in the tables below. Note, the specified values apply only if the P_CAL_ZERO value is set to 0000h.

$$PABS_{kPa} = \frac{PABS_{LSB} - PABSOFF_{LSB}}{PABS_{SENSE}} \quad (4)$$

Where:

$PABS_{kPa}$ = The absolute pressure output in kPa
$PABS_{LSB}$ = The absolute pressure output in LSB
$PABSOFF_{LSB}$ = The internal trimmed absolute pressure output value at 0 kPa in LSB
$PABS_{SENSE}$ = The trimmed absolute pressure sensitivity in LSB/kPa

| Range | Data reading | $PABSOff_{LSB}$ (LSB) | $PABS_{SENSE}$ (LSB/kPa) |
|---|---|---|---|
| 20 - 550 kPa | 12-bit | 159 | 7 |
| | 16-bit data read | 28990 | 14 |
| | Interrupt threshold registers | 28990 | 14 |
| | 16-bit register read | 0 | 105.6 |

### 7.3.5 Temperature sensor

#### 7.3.5.1 Temperature sensor signal chain

The device includes a temperature sensor for signal compensation and user readability. Figure 12 shows a simplified block diagram. Temperature sensor parameters are specified in Table 100 and Table 101.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

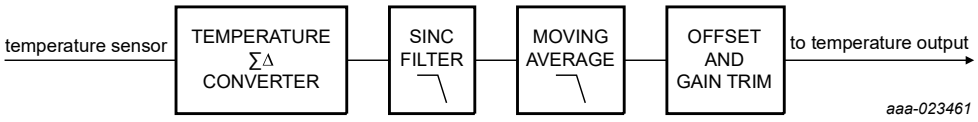

**Figure 12. Temperature sensor signal chain block diagram**

#### 7.3.5.2 Temperature sensor output scaling equation

Equation 5 is used to convert temperature readings with the variables specified in Table 7.

$$T_{DEGC} = \frac{T_{LSB} - T0_{LSB}}{T_{SENSE}} \quad (5)$$

where:

$T_{DEGC}$ = The temperature output in degrees C
$T_{LSB}$ = The temperature output in LSB
$T0_{LSB}$ = The expected temperature output in LSB at 0 °C
$T_{SENSE}$ = The expected temperature sensitivity in LSB/°C

**Table 7. Temperature conversion variables**

| Data reading | $T0_{LSB}$ (LSB) | $T_{SENSE}$ LSB/C) |
|---|---|---|
| 8-bit register read | 68 | 1 |

### 7.3.6 Common mode error detection signal chain

The device includes a continuous pressure transducer common mode error detection. A simplified block diagram is shown in the Figure 13. The common mode error signal is compared against the normal absolute pressure signal. If the comparison falls outside of pre-determined limits, the CM_ERROR bit in the DSP_STAT register is set. Once the error condition is removed, the CM_ERROR bit is cleared as specified in Section 7.7.16 "DSP_STAT - DSP specific status register (address 60h)".

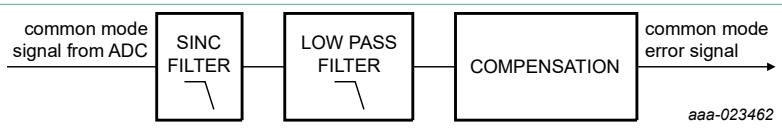

**Figure 13. Common mode error detection signal chain block diagram**

## 7.4 Inter-integrated circuit ($I^2C$) interface

The device includes an interface compliant to the NXP $I^2C$-bus specification[3]. The device operates in slave mode and includes support for standard mode, fast mode and fast mode plus, although the maximum practical operating frequency for $I^2C$ in a given system implementation depends on several factors including the pull-up resistor values and the total bus capacitance.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.4.1 I²C bit transmissions

The state of SDA when SCL is high determines the bit value being transmitted. SDA must be stable when SCL is high and change when SCL is low as shown in Figure 14. After the START signal has been transmitted by the master, the bus is considered busy. Timing for the start condition is specified in Table 101.

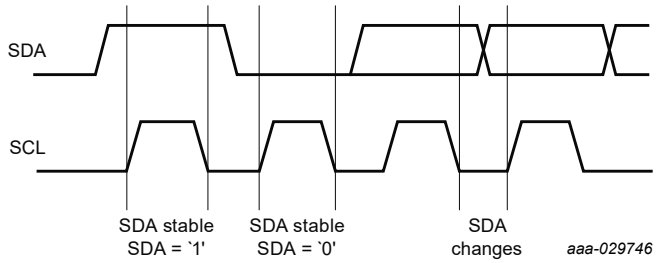

**Figure 14. I²C bit transmissions**

### 7.4.2 I²C start condition

A bus operation is always started with a start condition (START) from the master. A START is defined as a high to low transition on SDA while SCL is high as shown in Figure 15. After the START signal has been transmitted by the master, the bus is considered busy. Timing for the start condition is specified in Table 101.

A start condition (START) and a repeat START condition (rSTART) are identical.

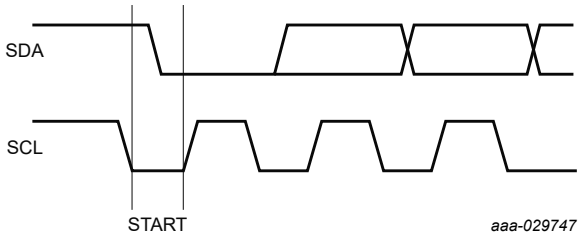

**Figure 15. I²C start condition**

### 7.4.3 I²C byte transmission

Data transfers are completed in byte increments. The number of bytes that can be transmitted per transfer is unrestricted. Each byte must be followed by an acknowledge bit (Section 7.4.4 "I2C acknowledge and not acknowledge transmissions") from the receiver. Data is transferred with the most significant bit (MSB) first (see Figure 16). The master generates all clock pulses, including the ninth clock for the acknowledge bit. Timing for the byte transmissions is specified in Section 7.4.4 "I2C acknowledge and not acknowledge transmissions". All functions for this device are completed within the acknowledge clock pulse. Clock stretching is not used.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

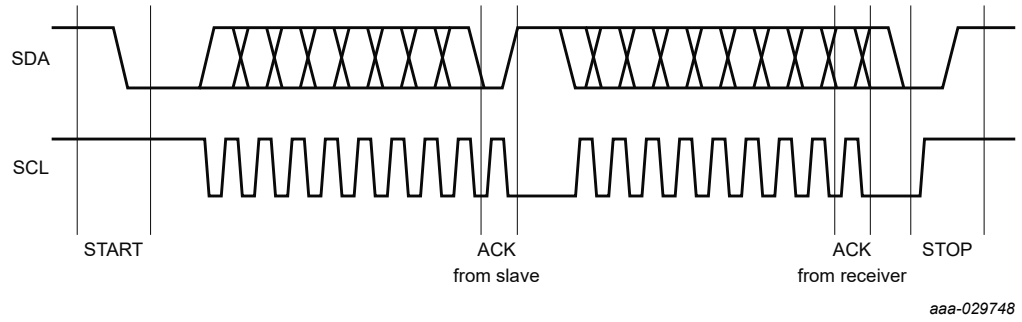

**Figure 16. I²C byte transmissions**

### 7.4.4 I²C acknowledge and not acknowledge transmissions

Each byte must be followed by an acknowledge bit (ACK) from the receiver. For an ACK, the transmitter releases SDA during the acknowledge clock pulse and the receiver pulls SDA low during the high portion of the clock pulse. Set up and hold times as specified in Table 101 must also be taken into account.

For a not acknowledge bit (NACK), SDA remains high during the entire acknowledge clock pulse. Five conditions lead to a NACK:

1. No receiver is present on the bus with the transmitted address.
2. The addressed receiver is unable to receive or transmit because it is performing some real-time function and is not ready to start communication with the master.
3. The receiver receives unrecognized data or commands.
4. The receiver cannot receive any more data bytes.
5. The master-receiver signals the end of the transfer to the slave transmitter.

Following a NACK, the master can transmit either a STOP to terminate the transfer, or a repeated START to initiate a new transfer.

An example ACK and NACK are shown in Figure 17.

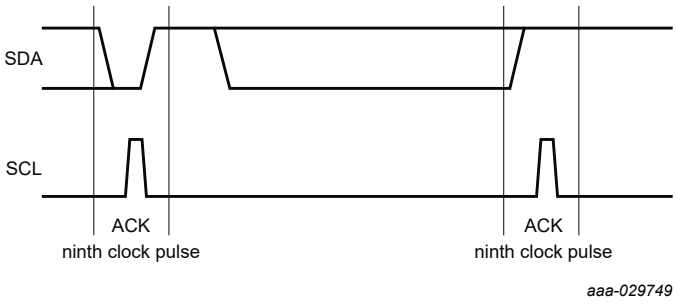

**Figure 17. I²C acknowledge and not acknowledge transmission**

### 7.4.5 I²C stop condition

A bus operation is always terminated with a stop condition (STOP) from the master. A STOP is defined as a low to high transition on SDA while SCL is high as shown in Figure 18. After the STOP has been transmitted by the master, the bus is considered free. Timing for the stop condition is specified in Table 101.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

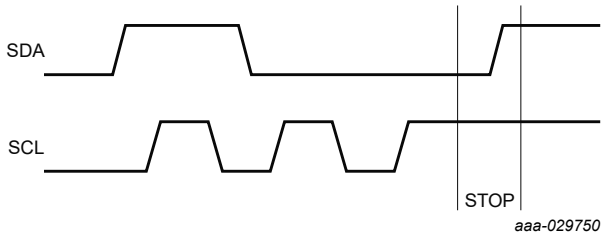

Figure 18. $I^2C$ stop condition

### 7.4.6 $I^2C$ register transfers

#### 7.4.6.1 Register write transfers

The device supports $I^2C$ register write data transfers. Register write data transfers are constructed as follows:

1. The master transmits a START condition.
2. The master transmits the 7-bit slave address.
3. The master transmits a '0' for the read/write bit to indicate a write operation.
4. The slave transmits an ACK.
5. The master transmits the register address to be written.
6. The slave transmits an ACK.
7. The master transmits the data byte to be written to the register address.
8. The slave transmits an ACK.
9. The master transmits a STOP condition.

The device automatically increments the register address allowing for multiple register writes to be completed in one transaction. In this case, the register write data transfers are constructed as follows:

1. The master transmits a START condition.
2. The master transmits the 7-bit slave address.
3. The master transmits a '0' for the read/write bit to indicate a write operation.
4. The slave transmits an ACK.
5. The master transmits the register address to be written.
6. The slave transmits an ACK.
7. The master transmits the data byte to be written to the register address.
8. The slave transmits an ACK.
9. The master transmits the data byte to be written to the register address +1.
10. The slave transmits an ACK.
11. Repeat steps 9 and 10 until all registers are written.
12. The master transmits a STOP condition.

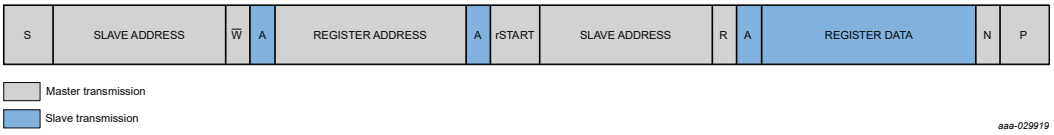

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

#### 7.4.6.2 Register read transfers

The device supports $I^2C$ register read data transfers. Register read data transfers are constructed as follows:

1. The master transmits a START condition.
2. The master transmits the 7-bit slave address.
3. The master transmits a '0' for the read/write bit to indicate a write operation.
4. The slave transmits an ACK.
5. The master transmits the register address to be read.
6. The slave transmits an ACK.
7. The master transmits a repeat START condition.
8. The master transmits the 7-bit slave address.
9. The master transmits a '1' for the read/write bit to indicate a read operation.
10. The slave transmits an ACK.
11. The slave transmits the data from the register addressed.
12. The master transmits a NACK.
13. The master transmits a STOP condition.

#### 7.4.6.3 Sensor data register read wrap around

The device includes automatic sensor data register read wrap-around features to optimize the number of $I^2C$ transactions necessary for continuous reads of sensor data. Depending on the state of the SIDx_EN bits in the SOURCEID_0 and SOURCEID_1 registers, the register address automatically wraps back to the DEVSTAT_COPY register as shown in Table 8.

**Table 8. Sensor data register read wrap-around description**

| SID1_EN | SID0_EN | Address increment and wrap-around effect | Optimized register-read sequence |
|---|---|---|---|
| 0 | 0 | Address wraps around from $FF to $00 | None |
| 0 | 1 | Address wraps from $63 (SNSDATA0_H) to $61 (DEVSTAT_COPY) | DEVSTAT_COPY, SNSDATA0_L, SNSDATA0_H |
| 1 | 0 | Address wraps from $65 (SNSDATA1_H) to $61 (DEVSTAT_COPY) | DEVSTAT_COPY, SNSDATA0_L, SNSDATA0_H, SNSDATA1_L, SNSDATA1_H |
| 1 | 1 | Address wraps from $69 (SNSDATA0_TIME3) to $61 (DEVSTAT_COPY) | DEVSTAT_COPY, SNSDATA0_L, SNSDATA0_H, SNSDATA1_L, SNSDATA1_H, SNSDATA0_TIME0, SNSDATA0_TIME1, SNSDATA0_TIME2, SNSDATA0_TIME3 |

### 7.4.7 I²C timing diagram

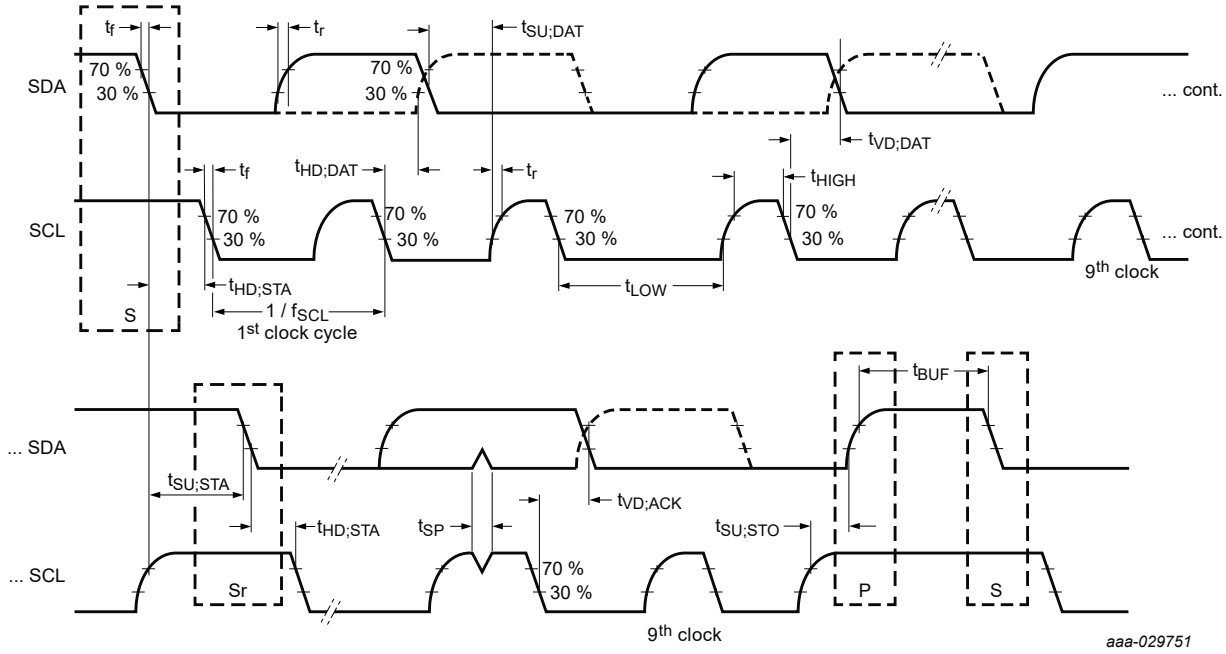

Figure 19. I²C timing diagram

## 7.5 Standard 32-bit SPI protocol

The device includes a standard SPI protocol requiring 32-bit data packets. The device is a slave device and requires that the base clock value be low (CPOL = 0) with data captured on the rising edge of the clock and data propagated on the falling edge of the clock (CPHA = 0). The most significant bit is transferred first (MSB first). SPI transfers are completed through a sequence of two phases. During the first phase, the command is transmitted from the SPI master to the device. During the second phase, response data is transmitted from the slave device. MOSI and SCLK transitions are ignored when SS_B is not asserted.

All information provided in this document is subject to legal disclaimers.

### 7.5.3 Command summary

#### 7.5.3.1 Register read command

The device supports a register read command. The register read command uses the upper 7 bits of the addresses defined in Section 7.6 "User-accessible data array" to address 8-bit registers in the register map.

The response to a register read command is shown in Section 7.5.3.1.2 "Register read response message format". The response is transmitted on the next SPI message if and only if all of the following conditions are met:

- No SPI error is detected (see Section 7.5.5.3 "SPI error" )
- No MISO error is detected (see Section 7.5.5.4 "SPI data output verification error")

If these conditions are met, the device responds to the register read request as shown in Section 7.5.3.1.2 "Register read response message format". Otherwise, the device responds with the error response as defined in Section 7.5.5.2 "Error responses". The register read response includes the register contents at the rising edge of SS_B for the register read command.

##### 7.5.3.1.1 Register read command message format

**Table 12. Register read command message format**

**Table 15. Register read response message bit field descriptions**

| Bit field | Definition |
|---|---|
| C[0], [3:1] | Register Read Command = '0110' |
| ST[1:0] | Status |
| RD[15:8] | The contents of the register addressed by RA[7:1] high byte (RA[0] = 1) |
| RD[7:0] | The contents of the register addressed by RA[7:1] low byte (RA[0] = 0) |
| CRC[7:0] | 8-bit CRC |

### 7.5.3.2 Register write command

The device supports a register write command. The register write command writes the value specified in RD[7:0] to the register addressed by RA[7:0].

The response to a register write command is shown in Section 7.5.3.2.2 "Register write response message format". The register write is executed and a response is transmitted on the next SPI message if and only if all of the following conditions are met:

- No SPI error is detected (see Section 7.5.5.3 "SPI error")
- No MISO error is detected (see Section 7.5.5.4 "SPI data output verification error")
- The ENDINIT bit is cleared
  - This applies to all registers with the exception of the RESET[1:0] bits in the DEVLOCK_WR register
- No invalid register request is detected as described below

If these conditions are met, the register write is executed and the device responds to the register write request as shown in Section 7.5.3.2.2 "Register write response message format". Otherwise, no register is written and the device responds with the error response as defined in Section 7.5.2 "SPI response format". The register is not written until the transfer during which the register write was requested has been completed.

A register write command to a read-only register will not execute, but will result in a valid response.

#### 7.5.3.2.1 Register write command message format

**Table 16. Register write command message format**

*MSB: bit 31; LSB: bit 0*

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 0 | 1 | 0 | 0 | ST[1:0] | | 0 | 0 | RD[15:8] | | | | | | | | RD[7:0] | | | | | | | | CRC[7:0] | | | | | | | |

**Table 19. Register write response message bit field descriptions**

| Bit field | Definition |
|---|---|
| C[0], [3:1] | Register Read Command = '0100' |
| ST[1:0] | Status |
| RD[15:8] | The contents of the register addressed by RA[7:1] high byte (RA[0] = 1) |
| RD[7:0] | The contents of the register addressed by RA[7:1] low byte (RA[0] = 0) |
| CRC[7:0] | 8-bit CRC |

### 7.5.3.3 Sensor data request commands

The device supports standard sensor data request commands. The sensor data request command format is described in Section 7.5.3.3.1 "Sensor data request command message format". The response to a sensor data request is shown in Section 7.5.3.3.2 "Sensor data request response message format". The response is transmitted on the next SPI message subject to the error handling conditions specified in Section 7.5.5 "Exception handling". The sensor data included in the response is the sensor data at the falling edge of SS_B for the sensor data request response.

#### 7.5.3.3.1 Sensor data request command message format

**Table 20. Sensor data request command message format**

*MSB: bit 31; LSB: bit 0*

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| CRC[7:0] | 8-bit CRC |

## 7.5.4 Error checking

### 7.5.4.1 Default 8-bit CRC

#### 7.5.4.1.1 Command error checking

The device calculates an 8-bit CRC on the entire 32 bits of each command. Message data is entered into the CRC calculator MSB first, consistent with the transmission order of the message. If the calculated CRC does not match the transmitted CRC, the command is ignored and the device responds with the SPI error response.

The CRC decoding procedure is as follows:

1. A seed value is preset into the LSB of the shift register.
2. Using a serial CRC calculation method, the receiver rotates the received message and CRC into the LSB of the shift register in the order received (MSB first).
3. When the calculation on the last bit of the CRC is rotated into the shift register, the shift register contains the CRC check result.
4. If the shift register contains all zeros, the CRC is correct.
5. If the shift register contains a value other than zero, the CRC is incorrect.

The CRC polynomial and seed are shown in Table 28.

**Table 28. SPI Command Message CRC**

| SPICRCSEED[3:0] | Default Polynomial | Default non-direct Seed |
|---|---|---|
| 0000 | $x^8 + x^5 + x^3 + x^2 + x + 1$ | 1111 1111 |
| non-zero | $x^8 + x^5 + x^3 + x^2 + x + 1$ | 1111 SPICRCSEED[3:0] |

#### 7.5.4.1.2 Response error checking

The device calculates a CRC on the entire 32 bits of each response. Message data is entered into the CRC calculator MSB first, consistent with the transmission order of the message.

The CRC encoding procedure is as follows:

1. A seed value is preset into the LSB of the shift register.
2. Using a serial CRC calculation method, the transmitter rotates the transmitted message and CRC into the LSB of the shift register (MSB first).
3. Following the transmitted message, the transmitter feeds 8 zeros into the shift register, to match the length of the CRC.
4. When the last zero is fed into the input adder, the shift register contains the CRC.
5. The CRC is transmitted.

The CRC polynomial and seed are shown in Table 29.

All information provided in this document is subject to legal disclaimers.

**Table 29. SPI Response Message CRC**

| SPICRCSEED[3:0] | Default Polynomial | Default non-direct Seed |
|---|---|---|
| 0000 | $x^8+ x^5+ x^3+ x^2+ x + 1$ | 1111 1111 |
| nonzero | $x^8+ x^5+ x^3+ x^2+ x + 1$ | 1111 SPICRCSEED[3:0] |

### 7.5.5 Exception handling

#### 7.5.5.1 Basic status field

All responses include a status field (ST[1:0]) that includes the general status of the device and transmitted data as described below. The contents of the status field is a representation of the device status at the rising edge of SS_B for the previous SPI command.

**Table 30. Basic status field for responses to register commands**

| ST[1:0] | | Status | Description | SF[1:0] | | Priority |
|---|---|---|---|---|---|---|
| 0 | 0 | Device in Initialization | Device in initialization (ENDINIT not set) | 0 | 0 | 3 |
| 0 | 1 | Normal Mode | Normal mode(ENDINIT set) | 0 | 0 | 4 |
| 1 | 0 | Self-test | Self-test(ST_CTRL[3:0] not equal to '0000') | 0 | 0 | 2 |
| 1 | 1 | Internal Error Present | Detailed Status Field | Detailed Status Field | | 1 |

#### 7.5.5.2 Error responses

**Table 31. Error responses bit field descriptions**

| SF[1:0] | | Status Sources | DEVSTAT State |
|---|---|---|---|
| 0 | 0 | Oscillator training error (OSCTRAIN_ERR)<br>Offset error (PABS_HIGH or PABS_LOW or CM_ERROR)<br>Temperature error | Bit set in DEVSTAT3<br>Bit set in DSP_STAT<br>Bit set in DEVSTAT2 |
| 0 | 1 | User OTP memory error (UF2 or UF1)<br>User R/W memory error (UF2)<br>NXP OTP Memory error | U_OTP_ERR set in DEVSTAT2<br>U_RW_ERR set in DEVSTAT2<br>F_OTP_ERR set in DEVSTAT2 |

| 1 | 1 | MISO error<br>SPI error | Bit set in DEVSTAT3<br>N/A |

#### 7.5.5.3 SPI error

The following external SPI conditions result in a SPI error:

- SCLK is high when SS_B is asserted
- The number of SCLK rising edges detected while SS_B is asserted is not equal to 16
- SCLK is high when SS_B is deasserted
- CRC error is detected (MOSI)
- A register write command to any register other than the DEVLOCK_WR register is received while ENDINIT is set

If a SPI error is detected, the device responds with the error response as described in Section 7.5.5.2 "Error responses" with the detailed status field set to “SPI Error” as defined in Section 7.5.5.1 "Basic status field".

#### 7.5.5.4 SPI data output verification error

The device includes a function to verify the integrity of the data output to the MISO pin. The function compares the data transmitted on the MISO pin to the data intended to be transmitted. If any one bit doesn't match, a SPI MISO mismatch fault is detected and the MISO_ERR flag in the DEVSTAT2 register is set.

If a valid sensor data request message is received during the SPI transfer with the MISO mismatch failure, the request is ignored and the device responds with the error response as described in Section 7.5.5.2 "Error responses" with the detailed status field set to “SPI Error” as defined in Section 7.5.5.1 "Basic status field" during the subsequent SPI message.

If a valid register write request message is received during the SPI transfer with the MISO mismatch failure, the register write is completed as requested, but the device responds with the error response as described in Section 7.5.5.2 "Error responses" with the detailed status field set to “SPI Error” as defined in Section 7.5.5.1 "Basic status field" during the subsequent SPI message.

If a valid register read request message is received during the SPI transfer with the MISO mismatch failure, the register read is ignored and the device responds with the error response as described in Section 7.5.5.2 "Error responses" with the detailed status field set to “SPI Error” as defined in Section 7.5.5.1 "Basic status field", during the subsequent SPI message.

## 7.6 User-accessible data array

A user-accessible data array allows each device to be customized. The array consists of a one time programmable (OTP) factory-programmable block, an OTP user-programmable block, and read-only registers for data and device status. The OTP blocks incorporate independent data verification.

**Table 32. User-accessible data — sensor specific information**

| Address | Register | Type[1] | Bit | | | | | | | |

## 7.7 Register information

### 7.7.1 COUNT - rolling counter register (address 00h)

The count register is a read-only register that provides the current value of a free-running 8-bit counter derived from the primary oscillator. A 10-bit prescaler divides the primary oscillator frequency by 1000. Thus, the value in the register increases by one count every 100 µs and the counter rolls over every 25.6 ms.

**Table 33. COUNT - rolling counter register (address 00h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | COUNT[7:0] | | | | | | | |
| **Reset** | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R | R | R | R | R | R | R | R |

### 7.7.2 Device status registers

The device status registers are read-only registers that contain device status information. These registers are readable in SPI or $I^2C$ mode.

All information provided in this document is subject to legal disclaimers.

#### 7.7.2.1 DEVSTAT - device status register (address 01h)

**Table 34. DEVSTAT - device status register (address 01h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | DSP_ERR | reserved | COMM_ ERR | MEMTEMP_ ERR | SUPPLY_ ERR | TEST MODE | DEVRES | DEVINIT |
| **Reset** | 1 | reserved | 0 | 0 | x | 0 | 1 | 1 |
| **Access** | R | R | R | R | R | R | R | R |

**Table 35. DEVSTAT - device status register (address 01h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7 | DSP_ERR | The DSP error flag is set if a DSP specific error is present in the pressure signal DSP:<br>*DSP_ERR = DSP_STAT[PABS_HIGH] \| DSP_STAT[PABS_LOW] \| DSP_STAT[ST_ INCMPLT] \| DSP_STAT[CM_ERROR] \| DSP_STAT[ST_ERROR]* |
| 5 | COMM_ERR | The communication error flag is set if any bit in DEVSTAT3 is set:<br>*COMM_ERR = MISO_ERR* |
| 4 | MEMTEMP_ERR | The memory error flag is set if any bit in DEVSTAT2 is set:<br>*MEMTEMP_ERR = F_OTP_ERR \| U_OTP_ERR \| U_RW_ERR \| U_W_ACTIVE \| TEMP0_ERR* |
| 3 | SUPPLY_ERR | The supply error flag is set if any bit in DEVSTAT1 is set:<br>*SUPPLY_ERR = VCCUV_ERR \| VCCOV_ER \| INTREG_ERR \| INTREGA_ERR \| INTREGF_ERR* |
| 2 | TESTMODE | The test mode bit is set if the device is in test mode. The TESTMODE bit can be cleared by a test mode operation or by a power cycle.<br>**0 —** Test mode is not active<br>**1 —** Test mode is active |
| 1 | DEVRES | The device reset bit is set following a device reset. This error is cleared by a read of the DEVSTAT register through any communication interface or on a data transmission that includes the error in the status field.<br>**0 —** Normal operation<br>**1 —** Device reset occurred |
| 0 | DEVINIT | The device initialization bit is set following a device reset. The bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0 —** Normal operation<br>**1 —** Device initialization in process |

#### 7.7.2.2 DEVSTAT1 - device status register (address 02h)

**Table 36. DEVSTAT1 - device status register (address 02h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | VCCUV_ ERR | reserved | VCCOV_ ERR | reserved | INTREGA_ ERR | INTREG_ ERR | INTREGF_ ERR | CONT_ERR |

**Table 37. DEVSTAT1 - device status register (address 02h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7 | VCCUV_ERR | The $V_{CC}$ undervoltage error bit is set if the $V_{CC}$ voltage falls below the voltage specified in Table 100. See Section 7.1 for details on the $V_{CC}$ undervoltage monitor. This bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0** — No error detected<br>**1** — $V_{CC}$ voltage low |
| 5 | VCCOV_ERR | The $V_{CC}$ overvoltage error bit is set if the $V_{CC}$ voltage rises above the voltage specified in Table 100. See Section 7.1 for details on the $V_{CC}$ overvoltage monitor. A common timer is used for all error bits in the DEVSTAT1 register. If any supply error is present, the timer is reset to $t_{UVOV_RCV}$. This bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0** — No error detected<br>**1** — $V_{CC}$ voltage high |
| 3 | INTREGA_ERR | The internal analog regulator voltage out-of-range error bit is set if the internal analog regulator voltage falls outside of expected limits. This bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0** — No error detected<br>**1** — Internal analog regulator voltage out of range |
| 2 | INTREG_ERR | The internal digital regulator voltage out-of-range error bit is set if the internal digital regulator voltage falls outside of expected limits. This bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0** — No error detected<br>**1** — Internal digital regulator voltage out of range |
| 1 | INTREGF_ERR | The internal OTP regulator voltage out-of-range error bit is set if the internal OTP regulator voltage falls outside of expected limits. This bit is cleared once sensor data is valid for read through one of the device communication interfaces ($t_{POR_DataValid}$).<br>**0** — No error detected<br>**1** — Internal OTP regulator voltage out of range |
| 0 | CONT_ERR | The continuity monitor passes a low current through a connection around the perimeter of the device and monitors the continuity of the connection. The error bit is set if a discontinuity is detected in the connection. A common timer is used for all error bits in the DEVSTAT1 register. If any supply error is present, the timer is reset to $t_{UVOV_RCV.}$ This bit is cleared based on the state of the SUP_ERR_DIS bit in the DEVLOCK_WR register as shown in Section 7.7.4.<br>**0** — No error detected<br>**1** — Error detected in the continuity of the edge seal monitor circuit |

#### 7.7.2.3 DEVSTAT2 - device status register (address 03h)

**Table 38. DEVSTAT2 - device status register (address 03h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | F_OTP_ERR | U_OTP_ERR | U_RW_ERR | U_W_ACTIVE | reserved | TEMP0_ERR | reserved | reserved |
| **Reset** | 0 | 0 | 0 | 0 | reserved | 0 | reserved | reserved |
| **Access** | R | R | R | R | R | R | R | R |

All information provided in this document is subject to legal disclaimers.

**Table 39. DEVSTAT2 - device status register (address 03h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7 | F_OTP_ERR | The NXP factory OTP array error bit is set if a fault is detected in the factory OTP array. This error is cleared by a read of the DEVSTAT2 register through any communication interface or on a data transmission that includes the error in the status field.<br>**0** — No error detected<br>**1** — Error detected in the NXP factory OTP array |
| 6 | U_OTP_ERR | The user OTP array error bit is set if a fault is detected in the user OTP array. This error is cleared by a read of the DEVSTAT2 register through any communication interface or on a data transmission that includes the error in the status field.<br>**0** — No error detected<br>**1** — Error detected in the user OTP array |
| 5 | U_RW_ERR | When ENDINIT is set, an error detection is enabled for all user writable registers. The error detection code is continuously calculated on the user writable registers and verified against a previously calculated error detection code. If a mismatch is detected in the error detection, the U_RW_ERR bit is set. This error is cleared by a read of the DEVSTAT2 register through any communication interface or on a data transmission that includes the error in the status field.<br>**0** — No error detected<br>**1** — Error detected in the user read/write array |
| 4 | U_W_ACTIVE | The user OTP write in process status bit is set if a user initiated write to OTP is currently in process. The U_W_ACTIVE bit is automatically cleared once the write to OTP is complete.<br>**0** — No OTP write in process<br>**1** — OTP write in process |
| 2 | TEMP0_ERR | The temperature error bit is set if an overtemperature or undertemperature condition exists. This error is cleared by a read of the DEVSTAT2 register through any communication interface or on a data transmission that includes the error in the status field.<br>**0** — No error detected<br>**1** — Overtemperature or undertemperature error condition detected |

#### 7.7.2.4 DEVSTAT3 - device status register (address 04h)

**Table 40. DEVSTAT3 - device status register (address 04h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | MISO_ERR | OSCTRAIN_ERR | reserved | reserved | reserved | reserved | reserved | reserved |
| **Reset** | 0 | 0 | reserved | reserved | reserved | reserved | reserved | reserved |

**Table 41. DEVSTAT3 - device status register (address 04h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7 | MISO_ERR | In SPI mode, the MISO data mismatch flag is set when a MISO Data mismatch fault occurs. The MISO_ERROR bit is cleared by a read of the DEVSTAT3 register through any communication interface, or by a status transmission including the error status through the SPI.<br>**0 —** No error detected<br>**1 —** MISO data mismatch |
| 6 | OSCTRAIN_ERR | The oscillator training error bit is set if an error detected in either the oscillator training settings, or the master communication timing. Once the error condition is corrected, the OSCTRAIN_ERR bit is cleared after a read of the OSCTRAIN_ERR bit through any communication interface, or by a status transmission including the error status through any communication interface.<br>**0 —** No error detected<br>**1 —** Oscillator training error |

### 7.7.3 TEMPERATURE - temperature register (address 0Eh)

The temperature register is a read-only register that provides a temperature value for the IC. The temperature value is specified in the temperature sensor signal chain section of Table 100.

***Note:*** *The device is only guaranteed to operate within the temperature limits specified in* Section 10 "Static characteristics ".

**Table 42. TEMPERATURE - temperature register (address 0Eh) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | TEMP[7:0] | | | | | | | |
| **Reset** | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R | R | R | R | R | R | R | R |

### 7.7.4 DEVLOCK_WR - lock register writes register (address 10h)

The lock register writes register is a read/write register that contains the ENDINIT bit and reset control bits.

**Table 43. DEVLOCK_WR - lock register writes register (address 10h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | ENDINIT | reserved | reserved | reserved | SUP_ERR_DIS | reserved | RESET[1:0] | |
| **Factory default** | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

**Table 44. DEVLOCK_WR - lock register writes register (address 10h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7 | ENDINIT | The ENDINIT bit is a control bit used to indicate that the user has completed all device and system level initialization tests. Once the ENDINIT bit is set, writes to all writable register bits are inhibited except for the DEVLOCK_WR register. Once set, the ENDINIT bit can only be cleared by a device reset.<br>When ENDINIT is set, the following occurs:<br>• An error detection is enabled for all user writable registers. The error detection code is continuously calculated on the user writable registers and verified against a previously calculated error detection code.<br>• Self-test is disabled and inhibited.<br>• Register writes are inhibited with the exception of the RESET[1:0] bits in the DEVLOCK_WR register. |
| 3 | SUP_ERR_DIS | The supply error disable bit allows the user to disable reporting of the supply errors in the SPI status fields. |
| 1 to 0 | RESET[1:0] | To reset the device, three consecutive register write operations must be performed in the order shown in Table 45, or the device will not reset.<br>The response to a register write returns the new register value, including the values written to the RESET[1:0] bits. After the third register write command, the device initiates a reset and thus does not transmit an acknowledge. The response to a register read returns '00' for RESET[1:0] and terminates the reset sequence. The reset control bits are not included in the read/write array error detection. |

**Table 45. Device reset command sequence**

| Register write to DEVLOCK_WR | RESET[0] | RESET[1] | Effect |
|---|---|---|---|
| Register write 1 | 0 | 0 | No effect |
| Register write 2 | 1 | 1 | No effect |
| Register write 3 | 0 | 1 | Device RESET |

### 7.7.5 UF_REGION_W, UF_REGION_R - UF region selection registers (address 14h, 15h)

The UF region load register is a user read/write register that contains the control bits for the UF0 and UF1 regions to be accessed. This register is included in the user read/write array error detection. The UF region active register is a read only register that contains the status bits for the UF0 and UF1 regions to be accessed. This register is included in the user read/write array error detection.

The UF_REGION_W register is readable and writable in SPI mode or $I^2C$ mode. The UF_REGION_R register is readable in SPI mode or $I^2C$ mode.

**Table 46. UF_REGION_W - UF region selection register (address 14h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | REGION_LOAD[3:0] | | | | 0 | 0 | 0 | 0 |
| **Factory default** | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

**Table 47. UF_REGION_R - UF region selection register (address 15h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | REGION_ACTIVE[3:0] | | | | 0 | 0 | 0 | 0 |
| **Factory default** | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R | R | R | R | R | R | R | R |

The user OTP regions UF0, UF1 and F share a block of 16 registers. Prior to reading the registers via any communication interface, the user must ensure that the desired OTP registers are loaded into the readable registers. Below is the necessary procedure to ensure proper reading of the UF0, UF1 and F registers.

1. Write the desired address range to be read to the REGION_LOAD[3:0] bits in the UF_REGION_W register using one of the communication interfaces available via the COMMTYPE register.

**Table 48. REGION_LOAD Bit Definitions**

| REGION_LOAD[3:0] | | | | OTP register addresses loaded into the readable registers |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | not applicable |
| 0 | 0 | 0 | 1 | not applicable |
| 0010 through 1001 | | | | reserved |
| 1 | 0 | 1 | 0 | Address Range $A0 through $AF |
| 1 | 0 | 1 | 1 | Address Range $B0 through $BF |
| 1 | 1 | 0 | 0 | Address Range $C0 through $CF |
| 1 | 1 | 0 | 1 | Address Range $D0 through $DF |
| 1 | 1 | 1 | 0 | Address Range $E0 through $EF |
| 1 | 1 | 1 | 1 | Address Range $F0 through $FF |

2. Add a delay (Refer to appropriate Application Note for specific communication protocol for delay values)
3. Optional: Execute a register read of the UF_REGION_R register and confirm the REGION_ACTIVE[3:0] bits match the values written to the REGION_LOAD[3:0] bits in the UF_REGION_W register.

**Table 49. REGION_ACTIVE Bit Definitions**

| REGION_ACTIVE[3:0] | | | | OTP register addresses loaded into the readable registers |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | Load of OTP registers is in process |
| 0 | 0 | 0 | 1 | The contents of the shared registers has been over-written by the user |
| 0010 through 1001 | | | | not applicable |
| 1 | 0 | 1 | 0 | Address Range $A0 through $AF |
| 1 | 0 | 1 | 1 | Address Range $B0 through $BF |
| 1 | 1 | 0 | 0 | Address Range $C0 through $CF |
| 1 | 1 | 0 | 1 | Address Range $D0 through $DF |
| 1 | 1 | 1 | 0 | Address Range $E0 through $EF |
| 1 | 1 | 1 | 1 | Address Range $F0 through $FF |

4. Execute a Register Read of the desired registers from the UF0, UF1 or F register section. Complete all desired Register Reads of the selected UF Region.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

5. Repeat steps 1 through 4 for the next desired UF region to read.

***Notes:***

- *The user must take care to ensure that the desired registers are addressed. For example, if the REGION_LOAD bits are set to Ah and the user executes a read of address $C2, the contents of registers $A2 will be transmitted. No error detection is included other than a read of the REGION_ACTIVE bits.*
- *For COMMTYPE options with multiple protocol options (COMMTYPE = '000' or '001'), no error detection is included other than a read of the REGION_ACTIVE bits. The user must take care to ensure that the REGION_LOAD, bits are not inadvertently changed by an alternative protocol while executing register reads.*
- *In SPI and $I^2C$ modes, once the ENDINIT bit is set, writes to registers other than the RESET[1:0] bits are inhibited. For this reason, reads of the UF0, UF1 and F registers will only be possible for the region selected by the REGION_ACTIVE bits at the time ENDINIT is set.*

### 7.7.6 COMMTYPE - communication type register (address 16h)

When writing to this register, care must be taken to prevent from inadvertently disabling the desired communication mode. Communication mode register value changes, that disable a protocol, including writes to OTP, will not take effect until a device reset occurs to prevent disabling a necessary communication method.

**Table 50. COMMTYPE - communication type register (address 16h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| **Reset** | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 51. COMMTYPE - communication type register (address 16h) bit description**

| Bit | Symbol | Description | |
|---|---|---|---|
| 2 to 0 | COMMTYPE[2:0} | Communication protocol selection | |
| | | 000 | 32-bit SPI (no internal self test, debug mode) |
| | | 001 | 32-bit SPI (with start up internal self test) |
| | | 010 | 32-bit SPI (no internal self test, debug mode) |
| | | 011 | reserved |
| | | 100 | 32-bit SPI (no internal self test, debug mode) |
| | | 101 | reserved |
| | | 110 | $I^2C$ (pin 3 acts as an Interrupt) |
| | | 111 | $I^2C$ (pin 3 acts as an interrupt) |

### 7.7.7 SOURCEID_x - source identification registers (address 1Ah, 1Bh)

The source identification registers are user programmed read/write registers that contain the source identification information used in SPI Mode. These registers are included in the read/write array error detection. These registers are readable and writable in SPI mode or $I^2C$ mode.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.7.8 TIMING_CFG - communication timing register (address 22h)

The communication timing configuration register is a user programmed read/write register that contains user specific configuration information for protocol timing. This register is included in the read/write array error detection. This register is readable and writable in SPI mode or $I^2C$ mode.

**Table 54. TIMING_CFG - communication timing register (address 22h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### 7.7.9 SPI Configuration Control Register (SPI_CFG, Address 3Dh)

In SPI mode, the SPI configuration control register is a user programmed read/write register that contains the SPI protocol configuration information. This register is included in the read/write array error detection. This register is readable and writable in SPI mode or $I^2C$ mode

**Table 55. SPI_CFG Register (address 3Dh) bit allocation**

#### 7.7.9.1 SPI Data Field Size (DATASIZE)

The SPI data field size bit controls the size of the SPI data field as shown in Table 56.

**Table 56. DATASIZE Bit Definition**

| DATASIZE | SPI Data Field Size |
|---|---|
| 0 | 12-Bits |
| 1 | 16-Bits |

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

#### 7.7.9.2 SPI CRC Length and Seed Bits

The SPI_CRC_LEN[1:0] bits select the CRC length for SPI Mode as shown in the table below. The SPI CRC seed bits contain the seed used for the SPI Mode. The default SPI CRC is an 8-bit. When the SPI_CRC_LEN[1:0] bits are set to a non-zero value using a Register Write command, the SPI CRC changes as defined in the table. The new polynomial value is enabled for both MISO and MOSI on the next SPI Mode command. The default seed (SPICRCSEED[3:0] = 0h) is FFh for an 8-bit CRC. When the value is changed to a non-zero value using a Register Write command, the SPI CRC seed changes to the value programmed as shown in the table. The new seed value is enabled for both MISO and MOSI on the next SPI Mode command.

**Table 57. SPI CRC Definition**

| SPI_CRC_LEN[1:0] | | SPICRCSEED | CRC Polynomial | CRC Seed |
|---|---|---|---|---|
| 0 | 0 | 0 | $x^8 + x^5 + x^3 + x^2 + x + 1$ | 1111, 1111 |
| 0 | 0 | non-zero | $x^8 + x^5 + x^3 + x^2 + x + 1$ | 0000, SPICRCSEED[3:0] |
| 0 | 1 | 0 | $x^4 + 1$ | 1010 |
| 0 | 1 | non-zero | $x^4 + 1$ | SPICRCSEED[3:0] |
| 1 | 0 | 0 | $x^3 + x + 1$ | 111 |
| 1 | 0 | non-zero | $x^3 + x + 1$ | SPICRCSEED[2:0] |
| 1 | 1 | 0 | $x^3 + x + 1$ | 111 |
| 1 | 1 | non-zero | $x^3 + x + 1$ | SPICRCSEED[2:0] |

### 7.7.10 WHO_AM_I - who am I register (address 3Eh)

The WHO_AM_I register is a user programmed read/write register that contains the unique product identifier. This register is included in the read/write array error detection.

**Table 58. WHO_AM_I - device identification register (address 3Eh) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | WHO_AM_I[7:0] | | | | | | | |
| **Factory default** (stored value) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Factory default** (read value) | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 |
| **Access** | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The default register value is 00h. If the register value is 00h, a value of C4h is transmitted in response to a read command. For all other register values, the actual register value is transmitted in response to a read command.

**Table 59. WHO_AM_I register values**

| WHO_AM_I register value (hex) | Response to a register read command |
|---|---|
| 00h | C4h |
| 01h to FFh | Actual register value |

### 7.7.11 I2C_ADDRESS - $I^2C$ slave address register (address 3Fh)

The $I^2C$ slave address register is a user programmed read/write register that contains the unique $I^2C$ slave address. The register is readable in all modes. This register is included in the read/write array error detection.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

**Table 60. I2C_ADDRESS - $I^2C$ slave address register (address 3Fh) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | I2C_ADDRESS[7:0] | | | | | | | |
| **Factory Default** (stored value) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Factory Default** (read value) | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The default register value is 00h. If the register value is 00h, the $I^2C$ slave address is 60h and a value of 60h is transmitted in response to a read command. If the register is written to a value other than 00h, the $I^2C$ slave address is the lower seven bits of the actual register value and the actual register value is transmitted in response to a read command.

### 7.7.12 DSP Configuration Registers (DSP_CFG_Ux)

The DSP Configuration registers (DSP_CFG_Ux) are a series of registers that affect the DSP data path.

There are 5 DSP Configuration registers, however, only DSP_CFG_U1, DSP_CFG_U4 and DSP_CFG_U5 are used when the device is in SPI or $I^2C$ mode. The DSP_CFG_U2 and DSP_CFG_U3 registers are for factory use only and are used for internal tests.

#### 7.7.12.1 DSP_CFG_U1 - DSP user configuration #1 register (address 40h)

The DSP user configuration register #1 is a user programmable read/write register that contains DSP specific configuration information. This register is included in the read/write array error detection.

Changes to this register reset the DSP data path. The contents of the SNSDATA_x registers are not guaranteed until the DSP has completed initialization as specified in Table 101. Reads of the SNSDATA_x registers and sensor data requests should be prevented during this time.

**Table 61. DSP_CFG_U1 - DSP user configuration #1 register (address 40h) bit allocation**

### 7.7.13 INT_CFG - interrupt configuration register (address 45h)

The interrupt configuration register contains configuration information for the interrupt output. This register can be written during initialization but is locked once the ENDINIT bit is set (see Section 7.7.4 "DEVLOCK_WR - lock register writes register (address 10h)"). The register is included in the read/write array error detection.

**Table 69. INT_CFG - interrupt configuration register (address 45h) bit allocation**

**Table 70. INT_CFG - interrupt configuration register (address 45h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 5 to 4 | INT_PS[1:0] | The INT_PS[1:0] bits set the programmable pulse stretch time for the interrupt output. Pulse stretch times are derived from the internal oscillator, so the tolerance on this oscillator applies.<br>**00 —** 0 ms<br>**01 —**16.000 ms to 16.512 ms<br>**10 —** 64.000 ms to 64.512 ms<br>**11 —** 256.000 ms to 256.512 ms<br>If the pulse stretch function is programmed to '00', the interrupt pin is asserted if and only if the interrupt condition exists after the most recent evaluated sample. The interrupt pin is deasserted if and only if an interrupt condition does not exist after the most recent evaluated sample.<br>If the pulse stretch function is programmed to a non-zero value, the interrupt pin is controlled only by the value of the pulse stretch timer value. If the pulse stretch timer value is non-zero, the interrupt pin is asserted. If the pulse stretch timer is zero, the interrupt pin is deasserted. The pulse stretch counter continuously decrements until it reaches zero. The pulse stretch counter is reset to the programmed pulse stretch value if and only if an interrupt condition exists after the most recent evaluated sample. |
| 3 | INT_POLARITY | The interrupt polarity bit controls whether the interrupt is activated for values within or outside of the window selected by the high and low threshold registers. With this bit and the programmable thresholds, a window comparator can be programmed for activation either within or outside of a window.<br>**0 —** Interrupt activated if the value is outside the window<br>**1 —** Interrupt activated if the value is inside the window |

### 7.7.14 P_INT_HI, P_INT_LO - interrupt window comparator threshold registers (address 46h to 49h)

The interrupt threshold registers contain the high and low window comparator thresholds for pressure to be used to activate and deactivate the interrupt output. These registers can be written during initialization but are locked once the ENDINIT bit is set (see Section 7.7.4 "DEVLOCK_WR - lock register writes register (address 10h)"). The register is included in the read/write array error detection.

**Table 71. P_INT_HI, P_INT_LO - interrupt window comparator threshold registers (address 46h to 49h) bit allocation**

| Location | | Bit | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| **Address** | **Register** | **8** | **7** | **6** | **5** | **4** | **3** | **2** | **1** | **0** |
| 46h | PIN_INT_HI_L | PIN_INT_HI[7:0] | | | | | | | | |
| 47h | PIN_INT_HI_H | PIN_INT_HI[15:8] | | | | | | | | |
| 48h | PIN_INT_LO_L | PIN_INT_LO[7:0] | | | | | | | | |
| 49h | PIN_INT_LO_H | PIN_INT_LO[15:8] | | | | | | | | |
| **Reset** | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The pressure threshold registers hold independent unsigned 16-bit values for a high and a low threshold. The window comparator threshold alignment is shown in Section 7.3.4.4 "Absolute pressure output data scaling equation".

If either the high or low threshold is programmed to 0000h, comparisons are disabled for that threshold only. The interrupt comparison still functions for the opposite threshold. If both the high and low thresholds are programmed to 0000h, the interrupt output is disabled.

### 7.7.15 P_CAL_ZERO - pressure calibration registers (address 4Ch, 4Dh)

The pressure calibration registers contain user programmable values to adjust the offset of the absolute pressure.

These registers can be written during initialization but are locked once the ENDINIT bit is set (see Section 7.7.4 "DEVLOCK_WR - lock register writes register (address 10h)").

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

These registers are included in the read/write array error detection. Changes to these registers reset the DSP data path. The contents of the SNSDATA_x registers are not guaranteed until the DSP has completed initialization, as specified in Table 101. Reads of the SNSDATA_x registers and sensor data requests should be prevented during this time.

**Table 72. P_CAL_ZERO - pressure calibration registers (address 4Ch, 4Dh) bit allocation**

| Location | | Bit | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Address** | **Register** | **7** | **6** | **5** | **4** | **3** | **2** | **1** | **0** |
| 4Ch | P_CAL_ZERO_L | P_CAL_ZERO[7:0] | | | | | | | |
| 4Dh | P_CAL_ZERO_H | P_CAL_ZERO[15:8] | | | | | | | |
| **Reset** | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The P_CAL_ZERO register value is a signed 16-bit value that is directly added to the internally calibrated pressure signal value as shown in Equation 6. The equation applies to the values in the 16-bit SNSDATA registers.

$$PABS_{kPa} = \left[\frac{PABS_{LSB} - PABSOFF_{LSB} + UserOffset}{PABS_{SENSE}}\right] \quad (6)$$

Where:

$PABS_{kPa}$ = The absolute pressure output in kPa
$PABS_{LSB}$ = The internal trimmed absolute pressure output in LSB
$PABSOFF_{LSB}$ = The internal trimmed absolute pressure output value at 0 kPa in LSB
$PABS_{SENSE}$ = The trimmed absolute pressure sensitivity in LSB/kPa
UserOffset = The 16-bit signed value programmed into the P_CAL_ZERO register

***Note:*** *The pressure calibration registers enable range and resolution options beyond the specified values of the device. The user must take care to ensure that the value stored in this register does not result in a compressed output range or a railed output.*

### 7.7.16 DSP_STAT - DSP specific status register (address 60h)

The DSP status register is a read-only register that contains sensor data specific status information.

**Table 73. DSP_STAT - DSP specific status register (address 60h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Symbol** | reserved | PABS_HIGH | PABS_LOW | reserved | ST_INCMPLT | ST_ACTIVE | CM_ERROR | ST_ERROR |
| **Factory default** | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| **Access** | R | R | R | R | R | R | R | R |

**Table 74. DSP_STAT - DSP specific status register (address 60h) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 6 | PABS_HIGH | The absolute pressure out-of-range high status bit is set if the absolute pressure exceeds the absolute pressure out-of-range high limit. The PABS_HIGH bit is cleared on a read of the DSP_STAT register through any communication interface or on a data transmission that includes the error in the status field. |

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

| Bit | Symbol | Description |
|---|---|---|
| 5 | PABS_LOW | The absolute pressure out-of-range low status bit is set if the absolute pressure exceeds the absolute pressure out-of-range low limit. The PABS_LOW bit is cleared on a read of the DSP_STAT register through any communication interface or on a data transmission that includes the error in the status field. |
| 3 | ST_INCMPLT | The self-test incomplete bit is set after a device reset and is only cleared when one of the analog or digital self-test modes is enabled in the ST_CTRL register (`ST_CTRL[3] = '1' \| ST_CTRL[2] = '1' \| \| ST_CTRL[1] = '1' \| \| ST_CTRL[0] = '1'`).<br>**0 —** An analog or digital self-test has been activated since the last reset.<br>**1 —** No analog or digital self-test has been activated since the last reset. |
| 2 | ST_ACTIVE | The self-test active bit is set if any self-test mode is currently active. The self-test active bit is cleared when no self-test mode is active.<br>`ST_ACTIVE= ST_CTRL[3] \| ST_CTRL[2] \| ST_CTRL[1] \| ST_CTRL[0]` |
| 1 | CM_ERROR | The absolute pressure common mode error status bit is set if the common mode value of the analog front end exceeds predetermined limits. The CM_ERROR bit is cleared on a read of the DSP_STAT register through any communication interface or on a data transmission that includes the error in the status field. |
| 0 | ST_ERROR | The self-test error flag is set if an internal self test fails as described in Section 7.3.2. This bit can only be cleared by a device reset. |

### 7.7.17 DEVSTAT_COPY - device status copy register (address 61h)

The device status copy register is a read-only register that contains a copy of the device status information contained in the DEVSTAT register. See Section 7.7.2.1 "DEVSTAT - device status register (address 01h)" for details regarding the DEVSTAT register contents. A read of the DEVSTAT_COPY register has the same effect as a read of the DEVSTAT register.

**Table 75. DEVSTAT_COPY - device status copy register (address 61h) bit allocation**

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| **Symbol** | DSP_ERR | reserved | COMM_ERR | MEMTEMP_ERR | SUPPLY_ERR | TESTMODE | DEVRES | DEVINIT |
| **Reset** | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | R | R | R | R | R | R | R | R |

### 7.7.18 SNSDATA0_L, SNSDATA0_H - sensor data #0 registers (address 62h, 63h)

The sensor data #0 registers are read-only registers that contain the 16-bit sensor data. See Section 7.3.4.4 "Absolute pressure output data scaling equation" for details regarding the 16-bit sensor data.

The SNSDATA0_H register value is latched on a read of the SNSDATA0_L register value until the SNSDATA0_H register is read. To avoid data mismatch, the user is required to always read the registers in sequence, SNSDATA0_L register first, followed by the SNSDATA0_H register.

**Table 76. SNSDATA0_L, SNSDATA0_H - sensor data #0 registers (addresses 62h, 63h) bit allocation**

| Location | | Bit | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|

| **Access** | | R | R | R | R | R | R | R | R |

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.7.19 SNSDATA1_L, SNSDATA1_H - sensor data #1 registers (address 64h, 65h)

The sensor data #1 registers are read-only registers that contain the 16-bit sensor data. See Section 7.3.4.4 "Absolute pressure output data scaling equation" for details regarding the 16-bit sensor data.

The SNSDATA1_H register value is latched on a read of the SNSDATA1_L register value until the SNSDATA1_H register is read. To avoid data mismatch, the user is required to always read the registers in sequence, SNSDATA1_L register first, followed by the SNSDATA1_H register.

**Table 77. SNSDATA1_L, SNSDATA1_H - sensor data #1 registers (address 64h, 65h) bit allocation**

| Location | | Bit | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Address** | **Symbol** | **7** | **6** | **5** | **4** | **3** | **2** | **1** | **0** |

| 65h | SNSDATA1_H | SNSDATA1_H[15:8] | | | | | | | |
| **Factory default** | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Access** | | R | R | R | R | R | R | R | R |

### 7.7.20 SNSDATA0_TIMEx - time stamp registers (address 66h to 6Bh)

The sensor data 0 time stamp registers are read-only registers that contain a 48-bit time stamp.

The value of the 48-bit free running timer register is copied to the sensor data 0 time stamp registers each time sensor data 0 data is latched for transmission. The time stamp is updated at the start of the sensor data 0 register value transmission for a register read of the SNSDATA0_L register.

The time stamp register is organized to allow for optimized reading of the time stamp in $I^2C$ automatic sensor data register read wrap-around mode as documented in Table 8.

The sensor data 0 time stamp registers are read-only registers that contain a 48-bit time stamp.

The value of the 48-bit free running timer register is copied to the sensor data 0 time stamp registers each time sensor data 0 data is latched for transmission via SPI.

**Table 78. SNSDATA0_TIMEx - time stamp register (address 66h to 6Bh) bit allocation**

| Location | | Bit | | | | | | | |

### 7.7.21 P_MAX, P_MIN - maximum and minimum absolute pressure value registers (address 6Ch to 6Fh)

The minimum and maximum absolute pressure value registers are read-only registers that contain a sample-by-sample continuously updated minimum and maximum 16-bit absolute pressure value. The value is reset to 0000h on a write to a DSP_CFG_U1 register that changes the value of the `LPF[2:0] or ST_CTRL[3:0]`.

The values of P_Max and P_Min obtained during a SPI or $I^2C$ register read might not always be the same value as the instantaneous pressure value obtained from the SNSDATA_x registers. The error will always be within 2 kPa of each other.

These registers are readable in SPI mode or $I^2C$ mode. In $I^2C$ mode the P_xxx_H register value is latched on a read of the P_xxx_L register value until the P_xxx_H register is read. To avoid data mismatch, the user is required to always read the registers in sequence, P_xxx_L register first, followed by the P_xxx_H register.

**Table 79. P_Max and P_Min registers (address 6Ch to 6Fh) bit allocation**

| Location | | Bit | | | | | | | |

| **Access** | | R | R | R | R | R | R | R | R |

### 7.7.22 FRT - free running timer registers (addresses 78h to 7Dh)

The free running timer registers are read-only registers that contain a 48-bit free running timer. The free running timer is clocked by the main oscillator frequency and increments every 100 ns.

**Table 80. FRT - free running timer registers (addresses 78h to 7Dh) bit allocation**

| Location | | Bit | | | | | | | |

### 7.7.23 DSP_CFG_F Register

The DSP configuration register is a factory programmable OTP register that contains DSP-specific configuration information. This register is included in the factory programmed OTP array error detection. This register is readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

### 7.7.24 IC type register (Address C0h)

The IC type register is a factory programmable OTP register that contains the IC type as defined below. This register is included in the factory programmed OTP array error detection. This register is readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

**Table 82. IC TYPE REGISTER (ICTYPEID address C0h) bit allocation**

### 7.7.25 IC manufacturer revision register (Address C1h)

The IC manufacturer revision register is a factory programmable OTP register that contains the IC revision. The upper nibble contains the main IC revision. The lower nibble contains the sub IC revision. This register is included in the factory programmed OTP array error detection. This register is readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

**Table 83. IC MANUFACTURER REVISION REGISTER (ICREVID address C1h) bit allocation**

### 7.7.27 Part number register (address C4h, C5h)

The part number registers are factory programmed OTP registers that include the numeric portion of the device part number. These registers are included in the factory programmed OTP array error detection. These register are readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

**Table 85. PN0 Register (address C4h) bit allocation**

### 7.7.28 Device serial number registers

The serial number registers are factory programmed OTP registers that include the unique serial number of the device. Serial numbers begin at 1 for all produced devices in each lot and are sequentially assigned. Lot numbers begin at 1 and are sequentially assigned. No lot will contain more devices than can be uniquely identified by the 14-bit serial number. Depending on lot size and quantities, all possible lot numbers and serial numbers might not be assigned. These registers are included in the factory programmed OTP array error detection. These registers are readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

### 7.7.29 ASIC wafer ID registers

The ASIC wafer ID registers are factory programmed OTP registers that include the wafer number, wafer X and Y coordinates and the wafer lot number for the device ASIC. These registers are included in the factory programmed OTP array error detection. These registers are readable in SPI mode or $I^2C$ mode when ENDINIT is not set.

### 7.7.30 USERDATA_0 to USERDATA_E - user data registers

User data registers are user programmable OTP registers that contain user specific information. These registers are included in the user programmed OTP array error detection. These registers are readable and writable in SPI mode or $I^2C$ mode when ENDINIT is not set.

### 7.7.31 USERDATA_10 to USERDATA_1E - user data registers

User data registers are user programmable OTP registers that contain user specific information. These registers are included in the user programmed OTP array error detection. These registers are readable and writable in SPI mode or $I^2C$ mode when ENDINIT is not set.

### 7.7.32 Lock and CRC Registers

The lock and CRC Registers are automatically programmed OTP registers that include the lock bit, the block identifier and the block OTP array CRC use for error detection. These registers are automatically programmed when the corresponding data array is programmed to OTP using the Write OTP Enable register.

**Table 97. Lock and CRC Register bit definitions**

| Location | | Bit | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Address | Register | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| $5F | CRC_UF2 | LOCK_UF2 | 0 | 0 | 0 | CRC_UF2[3:0] | | | |
| Factory Default | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $AF | CRC_F_A | LOCK_F_A | REGA_BLOCKID[2:0] | | | CRC_F_A[3:0] | | | |
| Factory Default | | 1 | 0 | 0 | 1 | varies | | | |
| $BF | CRC_F_B | LOCK_F_B | REGB_BLOCKID[2:0] | | | CRC_F_B[3:0] | | | |
| Factory Default | | 1 | 0 | 1 | 0 | varies | | | |
| $CF | CRC_F_C | LOCK_F_C | REGC_BLOCKID[2:0] | | | CRC_F_C[3:0] | | | |
| Factory Default | | 1 | 0 | 1 | 1 | varies | | | |
| $DF | CRC_F_D | LOCK_F_D | REGD_BLOCKID[2:0] | | | CRC_F_D[3:0] | | | |
| Factory Default | | 1 | 1 | 0 | 1 | varies | | | |
| $EF | CRC_F_E | LOCK_F_E | REGE_BLOCKID[2:0] | | | CRC_F_E[3:0] | | | |
| Factory Default | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $FF | CRC_F_F | LOCK_F_F | REGF_BLOCKID[2:0] | | | CRC_F_F[3:0] | | | |
| Factory Default | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 7.7.33 Reserved registers

A register read command to a reserved register or a register with reserved bits results in a valid response. The data for reserved bits may be '0' or '1'.

A register write command to a reserved register or a register with reserved bits executes and results in a valid response. The data for the reserved bits may be '0' or '1'. A write to the reserved bits must always be '0' for normal device operation and performance.

### 7.7.34 Invalid register addresses

A register read command to a register address outside of the addresses listed in Section 7.6 "User-accessible data array" results in a valid response. The data for the registers will be '00h'.

A register write command to a register address outside of the addresses listed in Section 7.6 "User-accessible data array" will not execute, but results in a valid response. The data for the registers will be '00h'.

A register write command to a read-only register will not execute, but results in a valid response. The data for the registers is the current content of the registers.

## 7.8 Read/write register array CRC verification

The writable registers (all registers with the exception of the DEVLOCK_WR register) are verified by a continuous 4-bit CRC that is calculated on the entire array once ENDINIT is set. The CRC verification uses a generator polynomial of $g(x) = X^4 + X^3 + 1$, with a seed value = '0000'.

# 8 Maximum ratings

Absolute maximum ratings are the limits the device can be exposed to without permanently damaging it. Absolute maximum ratings are stress ratings only; functional

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2019. All rights reserved.

operation at these ratings is not guaranteed. Exposure to absolute maximum ratings conditions for extended periods might affect device reliability.

This device contains circuitry to protect against damage due to high static voltage or electrical fields. NXP advises that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit.

**Table 98. Maximum ratings**

| Symbol | Parameter | Conditions | | Min | Max | Unit |
|---|---|---|---|---|---|---|
| $VCC_{MAX}$ | Supply Voltage | $V_{CC}$, $V_{CCIO}$ | [1] | — | +6.0 | V |
| $V_{IOMAX}$ | Input/Output Max on pins | INT, TESTx, SS_B, SCLK/SCL, MOSI , MISO/SDA | [1] | –0.3 | $V_{CC}$ + 0.3 | V |
| $h_{DROP}$ | Drop shock | To concrete, tile or steel surface, 10 drops, any orientation | [2] | — | 1.2 | m |
| $T_{stg}$ | Temperature range | Storage | [2] | –40 | +130 | °C |
| $T_J$ | | Junction | [1] [3] | –40 | +150 | °C |
| $P_{MAX}$ | Maximum absolute pressure | Continuous | [3] | — | 600 | kPa |
| $P_{BURST}$ | | Burst (tested at 100 ms) | [2] | — | 1650 | kPa |
| $P_{MIN}$ | Minimum absolute pressure | Continuous | [1] | — | 20 | kPa |
| $f_{SEAL}$ | Pressure sealing force | Applied to top face of package | [1] | — | 10 | N |
| $\theta_{JA}$ | Thermal resistance | | [4] | — | 120 | °C/W |
| **ESD and latch-up protection characteristics** | | | | | | |
| $V_{ESD}$ | Electrostatic discharge (per AEC-Q100, Rev H) | Human body model (HBM) | [2] | –2000 | 2000 | V |
| $V_{ESD}$ | | Charge device model (CDM) | [2] [5] | –500 | 500 | V |

[1] Parameter verified by parametric and functional validation.
[2] Parameter verified by qualification testing (Per AEC-Q100 Rev H or per NXP specification).
[3] Functionality verified by modeling, simulation and/or design verification.
[4] Thermal resistance provided with device mounted to a two-layer, 1.6 mm FR-4 PCB as documented in AN1902 with one signal layer and one ground layer.
[5] CDM tested at ±750 V for corner pins and ±500 V for all other pins.

**Caution**

This device is sensitive to mechanical shock. Improper handling can cause permanent damage to the part.

**Caution**

This is an ESD sensitive device. Improper handling can cause permanent damage to the part.

# 12 Media compatibility—pressure sensors only

For more information regarding media compatibility information, contact your local sales representative.

# 13 Application information

The FXPS7550D4 sensor can operate in two modes: $I^2C$ and SPI. The application diagrams in Figure 23 and Figure 24 show the modes and their respective biasing and bypass components.

The sensor can be configured to operate in SPI mode to read the user registers, self-test and diagnostics information. The application diagram in Figure 24 shows the SPI and the respective biasing and bypass components.

***Note:*** *A gel is used to provide media protection against corrosive elements which may otherwise damage metal bond wires and/or IC surfaces. Highly pressurized gas molecules may permeate through the gel and then occupy boundaries between material surfaces within the sensor package. When decompression occurs, the gas molecules may collect, form bubbles and possibly result in delamination of the gel from the material it protects. If a bubble is located on the pressure transducer surface or on the bond wires, the sensor measurement may shift from its calibrated transfer function. In some cases, these temporary shifts could be outside the tolerances listed in the data sheet. In rare cases, the bubble may bend the bond wires and result in a permanent shift.*

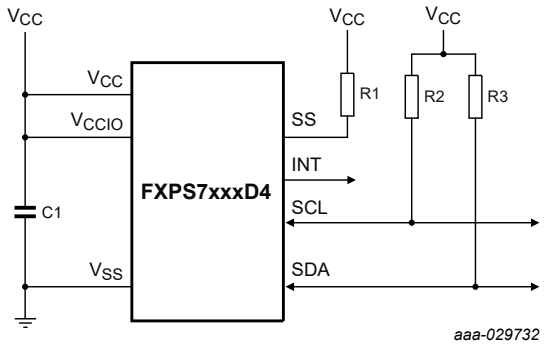

**Figure 23. $I^2C$ application diagram of FXPS7550D4**

**Table 102. External component recommendations for $I^2C$**

| Name | Type | Description | Purpose |
|---|---|---|---|
| C1 | Ceramic | 0.1 µF, 10 %, 10 V minimum, X7R | $V_{CC}$ power supply decoupling |
| R1 | General purpose | 1000 Ω, 5 %, 200 PPM | $I^2C$ selection pin pull-up resistor |
| R2 | General purpose | 1000 Ω, 5 %, 200 PPM | Serial clock pull-up resistor |
| R3 | General purpose | 1000 Ω, 5 %, 200 PPM | Serial data pull-up resistor |

# 17 Legal information

## 17.1 Data sheet status

| Document status[1][2] | Product status[3] | Definition |
|---|---|---|
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

## 17.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

## 17.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Suitability for use in automotive applications** — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected

All information provided in this document is subject to legal disclaimers.

to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

**Security** — While NXP Semiconductors has implemented advanced security features, all products may be subject to unidentified vulnerabilities. Customers are responsible for the design and operation of their applications and products to reduce the effect of these vulnerabilities on customer's applications and products, and NXP Semiconductors accepts no liability for any vulnerability that is discovered. Customers should implement appropriate design and operating safeguards to minimize the risks associated with their applications and products.

7.7.7 SOURCEID_x - source identification registers (address 1Ah, 1Bh) ..... 38
7.7.8 TIMING_CFG - communication timing register (address 22h) ..... 39
7.7.9 SPI Configuration Control Register (SPI_CFG, Address 3Dh) ..... 39
7.7.9.1 SPI Data Field Size (DATASIZE) ..... 39
7.7.9.2 SPI CRC Length and Seed Bits ..... 40
7.7.10 WHO_AM_I - who am I register (address 3Eh) ..... 40
7.7.11 I2C_ADDRESS - I2C slave address register (address 3Fh) ..... 40
7.7.12 DSP Configuration Registers (DSP_CFG_Ux) ..... 41
7.7.12.1 DSP_CFG_U1 - DSP user configuration #1 register (address 40h) ..... 41
7.7.12.2 DSP_CFG_U4 - DSP user configuration #4 register (address 43h) ..... 42
7.7.12.3 DSP_CFG_U5 - DSP user configuration #5 register (address 44h) ..... 42
7.7.13 INT_CFG - interrupt configuration register (address 45h) ..... 43
7.7.14 P_INT_HI, P_INT_LO - interrupt window comparator threshold registers (address 46h to 49h) ..... 44
7.7.15 P_CAL_ZERO - pressure calibration registers (address 4Ch, 4Dh) ..... 44
7.7.16 DSP_STAT - DSP specific status register (address 60h) ..... 45

7.7.17 DEVSTAT_COPY - device status copy register (address 61h) ..... 46
7.7.18 SNSDATA0_L, SNSDATA0_H - sensor data #0 registers (address 62h, 63h) .....46
7.7.19 SNSDATA1_L, SNSDATA1_H - sensor data #1 registers (address 64h, 65h) .....47
7.7.20 SNSDATA0_TIMEx - time stamp registers (address 66h to 6Bh) .....47
7.7.21 P_MAX, P_MIN - maximum and minimum absolute pressure value registers (address 6Ch to 6Fh) ..... 48
7.7.22 FRT - free running timer registers (addresses 78h to 7Dh) .....48
7.7.23 DSP_CFG_F Register ..... 48
7.7.24 IC type register (Address C0h) .....49
7.7.25 IC manufacturer revision register (Address C1h) ..... 49
7.7.26 IC manufacturer identification register (address C2h) .....49
7.7.27 Part number register (address C4h, C5h) .....50
7.7.28 Device serial number registers ..... 50
7.7.29 ASIC wafer ID registers .....51
7.7.30 USERDATA_0 to USERDATA_E - user data registers ..... 52
7.7.31 USERDATA_10 to USERDATA_1E - user data registers .....52
7.7.32 Lock and CRC Registers .....52
7.7.33 Reserved registers .....53
7.7.34 Invalid register addresses .....53
7.8 Read/write register array CRC verification .....53
**8 Maximum ratings .....53**
**9 Operating range ..... 55**
**10 Static characteristics ..... 55**
**11 Dynamic characteristics .....56**
**12 Media compatibility—pressure sensors only .....59**
**13 Application information .....59**
**14 Package outline .....61**
**15 References .....64**
**16 Revision history ..... 65**
**17 Legal information .....66**
