

INA20x-Q1 Automotive Grade, –16-V to +80-V, Low- or High-Side, High-Speed, Voltage-Output, Current-Sense Amplifier With Comparator and Reference

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: –40°C to 125°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level H2
 - Device CDM ESD Classification Level C3B
- Current-Sense Amplifier:
 - Common-Mode Range: –16 V to +80 V
 - 3.5% Max Error Over Temperature
 - Bandwidth: 500 kHz (INA200-Q1)
 - Three Gain Options:
 - 20 V/V (INA200-Q1)
 - 50 V/V (INA201-Q1)
 - 100 V/V (INA202-Q1)
- Integrated Open-Drain Comparator
 - Latching Capability
 - 0.6-V Internal Voltage Reference
- Quiescent Current: 1800 μ A (Max)
- Latch-Up Exceeds 100 mA per JESD78
- Package: VSSOP-8

2 Applications

- Electric Power Steering (EPS) Systems
- Body Control Modules
- Brake Systems
- Electronic Stability Control (ESC) Systems

3 Description

The INA200-Q1, INA201-Q1, and INA202-Q1 (INA20x-Q1) are low- or high-side current-shunt monitors with voltage output. The INA20x-Q1 devices can sense drops across shunts at common-mode voltages from –16 V to +80 V. The INA20x-Q1 are available with three output voltage scales: 20 V/V, 50 V/V, and 100 V/V, with up to a 500-kHz bandwidth.

The INA20x-Q1 also incorporate an open-drain comparator and internal reference that provides a 0.6-V threshold. External dividers set the current trip point. The comparator includes a latching capability, and can be made transparent by grounding (or leaving open) the RESET pin.

The INA20x-Q1 operate from a single 2.7-V to 18-V supply, drawing a maximum of 1800 μ A of supply current. These devices are available in the very small VSSOP-8 package. Specifications for all devices extend over the operating temperature range of –40°C to +125°C.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA200-Q1	VSSOP (8)	3.00 mm x 3.00 mm
INA201-Q1		
INA202-Q1		

(1) For all available packages, see the package option addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (November 2012) to Revision C	Page
Added <i>Device Information</i> and <i>ESD Ratings</i> , and <i>Thermal Information</i> tables, and <i>Feature Description</i> , <i>Device Functional Modes</i> , <i>Application and Implementation</i> , <i>Power Supply Recommendations</i> , <i>Layout</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> sections	1
Updated data sheet title	1
Updated Features bullets for clarity	1
Changed MSOP to VSSOP throughout data sheet to match industry-standard term	1
Updated Applications bullets	1
Updated Description section text for clarity	1
Changed all figures in data sheet to show Q1 device names	1
Changed pin names in Absolute Maximum Ratings to show correct names	4
Added Operating Temperature to <i>Absolute Maximum Ratings</i> table	4
Changed $CMP\ V_{OUT}$ to CMP_{OUT} in <i>large-signal differential voltage gain</i> parameter condition	6
Deleted package name from Figure 27	15
Changed Figure 28 caption	15
Changed text from " $R_{FILT} - 3\%$ " to " $R_{FILT} + 3\%$ " in 2nd paragraph of <i>Input Filtering</i> section	15
Changed 22-k Ω R_1 resistor to R_3 in Figure 31	18

Changes from Revision A (September 2012) to Revision B	Page
Changed from Mixed Production status to Production Data.	1
Changed device graphic from pair to single	1
Added AEC-Q100 info to <i>Features</i> bullets	1
Updated Applications bullets	1
Removed D package from pin configuration image.	4

5 Device Comparison Table

DEVICE	DESCRIPTION
INA193A-Q1	Same amplifier performance as INA200-Q1 without integrated comparator
INA203-Q1	Dual comparator alternative to the INA200-Q1 single comparator
INA282-Q1	Automotive, 80-V, bidirectional, high-accuracy, low- or high-side, voltage out current shunt monitor
INA300-Q1	Automotive, 36-V, low- or high-side, overcurrent protection comparator
INA301	Overcurrent protection, high-speed, precision, current sense amplifier with integrated comparator

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_S	Analog	Power supply
2	OUT	Analog output	Output voltage
3	CMP_{IN}	Analog input	Comparator input
4	GND	Analog	Ground
5	$\overline{RESET}$	Analog input	Comparator reset pin, active low
6	CMP_{OUT}	Analog output	Comparator output
7	V_{IN-}	Analog input	Negative input, connect to shunt low side
8	V_{IN+}	Analog input	Positive input, connect to shunt high side

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_S		2.7	18	V
Current-shunt monitor analog inputs, V_{IN+} , V_{IN-}	Differential ($V_{IN+} - V_{IN-}$)	–18	18	V
	Common mode ⁽²⁾ , $V_{CM} = (V_{IN+} + V_{IN-}) / 2$	–16	80	V
Comparator analog input and reset pins, CMP_{IN} and $RESET$ ⁽²⁾		GND – 0.3	$(V_S) + 0.3$	V
Analog output, OUT ⁽²⁾		GND – 0.3	$(V_S) + 0.3$	V
Comparator output, CMP_{OUT} ⁽²⁾		GND – 0.3	18	V
Input current into any pin ⁽²⁾			5	mA
Operating temperature, T_A		–40	125	°C
Junction temperature			150	°C
Storage temperature, T_{stg}		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) This voltage may exceed the ratings shown if the current at that pin does not exceed 5 mA.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per AEC Q100-011	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CM}	Common-mode input voltage	–16	12	80	V
V_S	Operating supply voltage	2.7	12	18	V
T_A	Operating free-air temperature	–40	25	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		INA20x-Q1	UNIT
		DGK (VSSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	162.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	37.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	82.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	81.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics: Current-Shunt Monitor

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = V_{IN+} - V_{IN-} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = \text{GND}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT						
V _{SENSE}	Full-scale sense input voltage	V _{SENSE} = V _{IN+} – V _{IN–}		0.15	(V _S – 0.25) / Gain	V
V _{CM}	Common-mode input range	T _A = –40°C to 125°C	–16		80	V
CMR	Common-mode rejection	V _{IN+} = –16 V to 80 V	80	100		dB
		V _{IN+} = 12 V to 80 V, T _A = –40°C to 125°C.	100	123		dB
V _{OS}	Offset voltage, RTI ⁽¹⁾	T _A = 25°C		±0.5	±2.5	mV
		T _A = 25°C to 125°C			±3	mV
		T _A = –40°C to 25°C			±3.5	mV
dV _{OS} /dT	Offset voltage, RTI, versus temperature	T _A = –40°C to 125°C		5		μV/°C
PSR	Offset voltage, RTI, versus power supply	V _{OUT} = 2 V, V _{IN+} = 18 V, 2.7 V, T _A = –40°C to 125°C		2.5	100	μV/V

		INA202-Q1		100		V/V
	Gain error	V _{SENSE} = 20 mV to 100 mV		±0.2%	±1%	
		V _{SENSE} = 20 mV to 100 mV, T _A = –40°C to 125°C			±2%	
	Total output error ⁽²⁾	V _{SENSE} = 120 mV, V _S = 16 V		±0.75%	±2.2%	
		V _{SENSE} = 120 mV, V _S = 16 V, T _A = –40°C to 125°C			±3.5%	
	Nonlinearity error ⁽³⁾	V _{SENSE} = 20 mV to 100 mV		±0.002%		
R _O	Output impedance			1.5		Ω
C _{LOAD}	Maximum capacitive load	No sustained oscillation		10		nF
OUTPUT (V _{SENSE} < 20 mV) ⁽⁴⁾						
Output		–16 V ≤ V _{CM} < 0 V	INA20x-Q1	300		mV
		0 V ≤ V _{CM} ≤ V _S , V _S = 5 V	INA200-Q1		0.4	V
			INA201-Q1		1	V
			INA202-Q1		2	V
		V _S < V _{CM} ≤ 80 V	INA20x-Q1	300		mV
VOLTAGE OUTPUT ⁽⁵⁾						
	Output swing to the positive rail	V _{IN–} = 11 V, V _{IN+} = 12 V, T _A = –40°C to 125°C		(V _S) – 0.15	(V _S) – 0.25	V
	Output swing to GND ⁽⁶⁾	V _{IN–} = 0 V, V _{IN+} = –0.5 V, T _A = –40°C to 125°C		(V _{GND}) + 0.004	(V _{GND}) + 0.05	V
FREQUENCY RESPONSE						
BW	Bandwidth	C _{LOAD} = 5 pF	INA200-Q1	500		kHz
			INA201-Q1	300		kHz
			INA202-Q1	200		kHz
	Phase margin	C _{LOAD} < 10 nF		40		Degrees
SR	Slew rate			1		V/μs
	Settling time (1%)	V _{SENSE} = 10 mV _{PP} to 100 mV _{PP} , C _{LOAD} = 5 pF		2		μs
NOISE, RTI						
	Voltage noise density			40		nV/√Hz

(1) Offset is extrapolated from measurements of the output at 20 mV and 100 mV V_{SENSE} .

(2) Total output error includes effects of gain error and V_{OS} .

(3) Linearity is best fit to a straight line.

(4) For details on this region of operation, see the [Accuracy Variations](#) section in the [Device Functional Modes](#).

(5) See [Figure 7](#).

(6) Specified by design.

7.6 Electrical Characteristics: Comparator

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, and $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE					
Threshold	$T_A = 25^\circ\text{C}$	590	608	620	mV
	$T_A = -40^\circ\text{C}$ to 125°C	586		625	mV
Hysteresis ⁽¹⁾	$T_A = -40^\circ\text{C}$ to 85°C		–8		mV
INPUT BIAS CURRENT⁽²⁾					
CMP_{IN} pin			0.005	10	nA
	$T_A = -40^\circ\text{C}$ to 125°C			15	nA
INPUT VOLTAGE RANGE					
CMP_{IN} pin			0 to $V_S - 1.5$		V
OUTPUT (OPEN-DRAIN)					
Large-signal differential voltage gain	$CMP_{OUT} = 1\text{ V}$ to 4 V , $R_L \geq 15\text{ k}\Omega$ connected to 5 V		200		V/mV
I_{LKG} High-level leakage current ⁽³⁾⁽⁴⁾	$V_{ID} = 0.4\text{ V}$, $V_{OH} = V_S$		0.0001	1	μA
V_{OL} Low-level output voltage ⁽³⁾	$V_{ID} = -0.6\text{ V}$, $I_{OL} = 2.35\text{ mA}$		220	300	mV
RESPONSE TIME					
Response time ⁽⁵⁾	R_L to 5 V , $C_L = 15\text{ pF}$, 100-mV input step with 5-mV overdrive		1.3		μs
RESET					
$\overline{\text{RESET}}$ threshold ⁽⁶⁾			1.1		V
Logic input impedance			2		M Ω
Minimum $\overline{\text{RESET}}$ pulse duration			1.5		μs
$\overline{\text{RESET}}$ propagation delay			3		μs

- (1) Hysteresis refers to the threshold (the threshold specification applies to a rising edge of a noninverting input) of a falling edge on the noninverting input of the comparator; see [Figure 25](#).
- (2) Specified by design.
- (3) V_{ID} refers to the differential voltage at the comparator inputs.
- (4) Pulling the open-drain output to the range of 2.7 V to 18 V is permissible, regardless of V_S .
- (5) The comparator response time specified is the interval between the input step function and the instant when the output crosses 1.4 V.
- (6) The $\overline{\text{RESET}}$ input has an internal 2-M Ω (typical) pulldown. Leaving $\overline{\text{RESET}}$ open results in a low state, with transparent comparator operation.

7.7 Electrical Characteristics: General

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = 1\text{ V}$ (unless otherwise noted)

GENERAL PARAMETERS	CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY					
I_Q Quiescent current	$V_{OUT} = 2\text{ V}$		1350	1800	μA
	$V_{SENSE} = 0\text{ mV}$, $T_A = -40^\circ\text{C}$ to 125°C			1850	μA
Comparator power-on reset threshold ⁽¹⁾			1.5		V

- (1) The INA20x-Q1 devices power up with the comparator in a defined reset state as long as the $\overline{\text{RESET}}$ pin is open or grounded. The comparator is in reset as long as the power supply is below the voltage shown here. The comparator assumes a state based on the comparator input above this supply voltage. If $\overline{\text{RESET}}$ is high at power up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

7.8 Typical Characteristics

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, and $V_{SENSE} = 100\text{ mV}$ (unless otherwise noted)

9 Detailed Description

9.1 Overview

The INA20x-Q1 current-shunt monitors operate over a wide common-mode voltage range (–16 V to +80 V). These devices integrate an open-drain comparator with an internal 0.6-V reference at the negative input. Use external dividers from the output of the current shunt monitor to the positive input of the comparator to set the positive input for overcurrent detection. The comparator includes a latching capability, but can also be made transparent by grounding (or floating) the RESET pin.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Comparator

The INA200-Q1, INA201-Q1, and INA202-Q1 devices incorporate an open-drain comparator. This comparator typically has 2 mV of offset and a 1.3 μ s (typical) response time. The RESET pin latches and resets the output of the comparator; see [Figure 26](#).

Figure 26. Comparator Latching Capability

9.3.2 Output Voltage Range

The output of the INA20x-Q1 is accurate within the output voltage swing range set by the power supply pin, V_S . Best illustration of this performance occurs when using the INA202-Q1 (gain-of-100 version), where a 100-mV full-scale input from the shunt resistor requires an output voltage swing of 10 V, and a power-supply voltage sufficient to achieve 10 V on the output.

9.4 Device Functional Modes

The INA20x-Q1 have a single functional mode and are operational when the power-supply voltage is greater than 2.7 V. The common-mode voltage must be between –16 V and +80 V. The maximum power supply voltage for the INA20x-Q1 is 18 V.

10 Application Information

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The INA20x-Q1 series is designed to enable easy configuration for detecting overcurrent conditions and current monitoring in an application. This device is individually targeted towards overcurrent detection of a single threshold. However, this device can also be paired with additional devices and circuitry to create more complex monitoring functional blocks.

10.1.1 Basic Connections

Figure 27 shows the basic connections of the INA200-Q1, INA201-Q1, and INA202-Q1. Connect the input pins, V_{IN+} and V_{IN-} , as close as possible to the shunt resistor to minimize any resistance in series with the shunt resistance.

Stability requires the use of power-supply bypass capacitors. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

Figure 27. INA200-Q1 Basic Connections

10.1.2 Selecting R_S

The value chosen for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, whereas low values of R_S minimize voltage loss in the supply line. Most applications attain best performance with an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV. Maximum input voltage for accurate measurements is 500 mV, but output voltage is limited by supply.

Application Information (continued)

10.1.4.1 Normal Case 1: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} \geq V_S$

This region of operation provides the highest accuracy. Here, use of a two-step method characterizes and measures the input offset voltage. First, Equation 2 determines the gain.

$$G = \frac{V_{OUT1} - V_{OUT2}}{100\text{mV} - 20\text{mV}} \quad (2)$$

where:

V_{OUT1} = output voltage with $V_{SENSE} = 100 \text{ mV}$

V_{OUT2} = output voltage with $V_{SENSE} = 20 \text{ mV}$

Then the offset voltage is measured at $V_{SENSE} = 100 \text{ mV}$ and referred to the input (RTI) of the current shunt monitor, as shown in Equation 3.

$$V_{OS\text{RTI}} (\text{Referred-To-Input}) = \left[\frac{V_{OUT1}}{G} \right] - 100\text{mV} \quad (3)$$

In the *Typical Characteristics*, Figure 6 (*Output Error versus Common-Mode Voltage* curve) shows the highest accuracy for the this region of operation. In this plot, $V_S = 12 \text{ V}$; for $V_{CM} \geq 12 \text{ V}$, the output error is at its minimum. Using this case also creates the $V_{SENSE} \geq 20 \text{ mV}$ output specifications in the *Electrical Characteristics: Current-Shunt Monitor* table.

10.1.4.2 Normal Case 2: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} < V_S$

This region of operation has slightly less accuracy than Normal Case 1 as a result of the common-mode operating area in which the part functions, as seen in the Figure 6 (*Output Error versus Common-Mode Voltage* curve). As noted, for this graph $V_S = 12 \text{ V}$; for $V_{CM} < 12 \text{ V}$, the output error increases as V_{CM} becomes less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16 \text{ V}$.

10.1.4.3 Low V_{SENSE} Case 1: $V_{SENSE} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{CM} < 0 \text{ V}$; and Low V_{SENSE} Case 3: $V_{SENSE} < 20 \text{ mV}$, $V_S < V_{CM} \leq 80 \text{ V}$

Although not designed for accurate operation in either of these regions, the INA20x-Q1 family of devices may have exposure to these conditions in some applications. For example, when monitoring power supplies being switched on and off with V_S still applied to the INA20x-Q1, it is important to know what the device behavior is in these regions.

As V_{SENSE} approaches 0 mV, in these V_{CM} regions, the device output accuracy degrades. A larger-than-normal offset can appear at the current shunt monitor output with a typical maximum value of $V_{OUT} = 300 \text{ mV}$ for $V_{SENSE} = 0 \text{ mV}$. As V_{SENSE} approaches 20 mV, V_{OUT} returns to the expected output value with accuracy, as specified in the *Electrical Characteristics: Current-Shunt Monitor*. Figure 29 illustrates this effect using the INA202-Q1 (gain = 100).

Figure 29. Example for Low V_{SENSE} Cases 1 and 3 (INA202-Q1, Gain = 100)

Application Information (continued)

10.1.4.4 Low V_{SENSE} Case 2: $V_{SENSE} < 20\text{ mV}$, $0\text{ V} \leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA20x-Q1 family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive-input common-mode voltage range, and the other in the negative-input region. For this case, neither of these two internal amplifiers dominates, and overall loop gain is very low. Within this region, V_{OUT} approaches voltages close to linear operation levels for *normal case 2*. This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V. Within this region, as V_{SENSE} approaches 20 mV, device operation is closer to that described by *normal case 2*. Figure 30 illustrates this behavior for the INA202-Q1. To test the V_{OUT} maximum peak for this case, maintain a constant V_S , set $V_{SENSE} = 0\text{ mV}$, and sweep V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this test varies from part to part, but the tested V_{OUT} maximum peak for any part is less than the specified V_{OUT} test limit.

NOTE: (1) INA200 V_{OUT} Tested Limit = 0.4V. INA201 V_{OUT} Tested Limit = 1V.

Figure 30. Example for Low V_{SENSE} Case 2 (INA202-Q1, Gain = 100)

10.1.5 Transient Protection

The -16 V to $+80\text{ V}$ common-mode range of the INA20X-Q1 is ideal for withstanding automotive fault conditions, ranging from 12-V battery reversal up to 80-V transients, because there is need for additional protective components up to those levels. In the event that the INA20x-Q1 are exposed to transients on the inputs in excess of their ratings, then external transient absorption with semiconductor transient absorbers (such as Zeners) is necessary. Do not use metal-oxide varistors (MOVs) or voltage-dependent resistors (VDRs) except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it never allows exposure of the INA20X-Q1 to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage due to transient absorber dynamic impedance). Despite the use of internal zener-type ESD protection, the INA20x-Q1 do not lend themselves to using external resistors in series with the inputs, because the internal gain resistors can vary up to $\pm 30\%$. (If gain accuracy is not important, then one can add resistors in series with the INA20x-Q1 inputs with two equal resistors on each input.)

10.2 Typical Applications

10.2.1 Low-Side Switch Overcurrent Shutdown

The INA20x-Q1 measures current through a resistive shunt with current flowing in one direction, thus enabling detection of an overcurrent event only when the differential input voltage exceeds the threshold limit. When the current reaches the set limit of the divider R_1 / R_2 , the output of CMP_{OUT} transitions high and Q1 turns on and pull the gate of the Pass-FET low and turn off the flow off current.

NOTE: In this case, Q1 is used to invert the comparator output.

Figure 31. Low-Side Switch Overcurrent Shutdown

10.2.1.1 Design Requirements

For this design example, use the input parameters shown in Table 1. All other register settings are default.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Supply voltage, V_S	3.3 V
R_2 / R_1	1.5
R2	15 kΩ
R1	10 kΩ
Gain	20 V/V (INA200-Q1)
Shunt resistor, R_{SHUNT}	5 mΩ
Desired trip current, I_{TRIP}	1 A

10.2.1.2 Detailed Design Procedure

Figure 31 shows the basic connections for a low-side, switch overcurrent shutdown application. Connect input pins IN+ and IN– as close as possible to the current-sensing resistor (R_{SHUNT}) to minimize any resistance in series with the shunt resistance. Additional resistance between the current-sensing resistor and input pins can result in errors in the measurement. When input current flows through this external input resistance, the voltage developed across the shunt resistor can differ from the voltage reaching the input pins. Connect the input pins to one of the three shunt options shown in Figure 31.

Use the device gain and shunt resistor value to calculate the OUT pin voltage, V_{OUT_TRIP} , for the desired trip current, as shown in Equation 4:

$$V_{OUT_TRIP} = I_{TRIP} \times R_{SHUNT} \times \text{Gain}$$

where

- I_{TRIP} = Desired trip current
 - R_{SHUNT} = Shunt resistor value
- (4)

Configure R_1 and R_2 so that the current trip point is equal to the 0.6-V reference voltage, as shown in Equation 5:

$$(R_2 / (R_1 + R_2)) \times V_{OUT_TRIP} = 0.6 \text{ V}$$

(5)

10.2.1.3 Application Curves

Figure 32. Low-Side Switch Overcurrent Shutdown Response

10.2.2 High-Side Switch Overcurrent Shutdown

Figure 33 shows the basic connection for a high-side, switch overcurrent shutdown application. The high-side PMOS switch disconnects when an overcurrent event occurs. The previous [Detailed Design Procedure](#) section describes how to apply this application example. The difference is that the current is sensed on the high side of the bus in this application, and the low side of the bus in the previous application example.

NOTE: Q cascodes the comparator output to drive a high-side FET (the 2N3904 shown is good up to 60 V). The shunt can be located in any one of the three locations shown. Use the latching capability in shutdown applications to prevent oscillation at the trip point.

Figure 33. High-Side Switch Overcurrent Shutdown

10.2.3 Bidirectional Overcurrent Comparator

Figure 34 shows the basic connection for a bidirectional overcurrent comparator using two INA20x-Q1 devices of the same gain.

NOTE: It is possible to set different limits for each direction.

Figure 34. Bidirectional Overcurrent Comparator

11 Power Supply Recommendations

The input circuitry of the INA20x-Q1 accurately measures beyond the power-supply voltage, V_S . For example, the V_S power supply can be 5 V, whereas the load power-supply voltage goes up to 80 V. However, the voltages on the power-supply pins limit the output voltage range of the OUT pin.

12 Layout

12.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or four-wire connection. This connection technique makes sure that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Add additional decoupling capacitance to compensate for noisy or high-impedance power supplies.

12.2 Layout Example

13.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

13.3 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

13.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
INA200AQDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	SHZ	Samples
INA201AQDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	QWV	Samples
INA202AQDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	SIA	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
