

General Description

The MAX17681E evaluation kit (EV kit) is a fully assembled and tested circuit board that demonstrates the performance of the MAX17681 high-efficiency, iso-buck, DC-DC converter. The EV kit operates over a wide input-voltage range of 17V to 36V and uses primary-side feedback to regulate the output voltage. The EV kit output is programmed to $\pm 15\text{V}$, 75mA each and $\pm 7.5\text{V}$, 75mA each with $\pm 10\%$ regulation.

The EV kit comes installed with the MAX17681 in a 10-pin (3mm x 2mm) TDFN package.

Features

- 17V to 36V Input Voltage Range
- $\pm 15\text{V}$, 75mA Each and $\pm 7.5\text{V}$, 75mA Each Continuous Current
- EN/UVLO Input
- 200kHz Switching Frequency
- 86.9% Peak Efficiency
- Overcurrent Protection
- No Optocoupler
- Delivers Up to 3.4W Output Power
- Overtemperature Protection
- Proven PCB layout

[Ordering Information](#) appears at end of data sheet.

Quick Start

Recommended Equipment

- One 15V–60V DC, 0.5A power supply
- Four resistive loads, each 75mA sink capacity
- Four digital multimeters (DMM)

Caution: Do not turn on the power supply until all connections are completed.

Test Procedure

- 1) Verify that J1 is open.
- 2) Set the power supply output to 24V. Disable the power supply.
- 3) Connect the positive terminal of the power supply to the V_{IN} PCB pad and the negative terminal to the nearest PGND PCB pad.
- 4) Connect the first resistive load across the +15V PCB pad and the GND0 PCB pad. Connect the second 75mA resistive load across the -15V PCB pad and the GND0 PCB pad.
- 5) Connect the third 75mA resistive load across the +7V PCB pad and the GND0 PCB pad. Connect the fourth 75mA resistive load across the -7V PCB pad and the GND0 PCB pad.
- 6) Connect two DMMs configured in voltmeter mode across the $\pm 15\text{V}$ PCB pads and the nearest GND0 PCB pad. Also, connect another two DMMs configured in voltmeter mode across the $\pm 7\text{V}$ PCB pads and the nearest GND0 PCB pad.
- 7) Enable the input power supply.
- 8) Verify that output voltages are at $\pm 15\text{V}$ and $\pm 7.5\text{V}$ (with allowable tolerance of $\pm 10\%$) with respect to GND0.
- 9) If required, vary the input voltage from 17V to 36V, and the load current from 0mA to 75mA and verify that output voltages are $\pm 15\text{V}$ and $\pm 7.5\text{V}$.

Detailed Description

The MAX17681E EV kit is a fully assembled and tested circuit board that demonstrates the performance of the MAX17681 high-efficiency, iso-buck, DC-DC converter designed to provide an isolated power up to 3.4W. The EV kit generates either $\pm 15V$ or $\pm 7.5V$, 75mA each output voltages, from a 17V to 36V input supply. The EV kit features a forced-PWM control scheme that provides constant switching-frequency of 200kHz operation at all load and line conditions.

The EV Kit includes an EN/UVLO PCB pad to monitor and program the EN/UVLO pin of the MAX17681. The V_{PRI} PCB pad helps measure the regulated primary output voltage (V_{PRI}). An additional $\overline{RESET}$ PCB pad is available for monitoring the health of primary output voltage (V_{PRI}). $\overline{RESET}$ pulls low if FB voltage drops below 92.5% of its set value. $\overline{RESET}$ goes high-impedance 1024 clock cycles after FB voltage rises above 95.5% of its set value. The programmable soft-start feature allows users to reduce the input inrush current.

The iso-buck is a synchronous-buck-converter-based topology, useful for generating isolated outputs at low power level without using an optocoupler. The detailed

procedure for setting the soft-start time, ENABLE/UVLO divider, primary output voltage (V_{PRI}) selection, adjusting the primary output voltage, primary inductance selection, turns-ratio selection, output capacitor selection, output diode selection and external loop compensation are given in the MAX17681 IC data sheet.

Enable Control (J1)

The EN/UVLO pin on the device serves as an on/off control while also allowing the user to program the input undervoltage lockout (UVLO) threshold. Jumper J1 configures the EV kit's output for turn-on/turn-off control. Install a shunt across jumper J1 pins 2-3 to disable V_{OUT} . See [Table1](#) for proper J1 jumper configurations.

NOTE 1: The secondary output diodes D1, D2, D3, and D4 are rated to carry short-circuit current only for few 100's of ms and is not rated to carry the continuous short-circuit current.

NOTE 2: The iso-buck converter typically needs 10% minimum load to regulate the output voltage. In this design when the +24V rail is healthy, the U2, U3 sinks the minimum load current required to regulate the output voltages within $\pm 10\%$ regulation.

Table1. Enable Control (EN/UVLO) (J1) Jumper Settings

SHUNT POSITION	EN/UVLO PIN	VOUT OUTPUT
J1		
1-2	Connected to V_{IN}	Enabled
2-3	Connected to GND	Disabled
Open*	Connected to midpoint of R1, R2 resistor-divider	Enabled at $V_{IN} \geq 15.5V$
