

MAX17608 Evaluation Kit

Evaluates: MAX17608 – 4.5V to 60V, 1A, OV, UV, Reverse-Voltage Protector with Forward/Reverse Current Limit

General Description

The MAX17608 evaluation kit (EV kit) is a fully assembled and tested circuit board that demonstrates the MAX17608 4.5V to 60V, 1A, OV, UV, reverse-voltage protector with forward/reverse current-limit in a 12-pin TDFN-EP package. The EV kit can be configured to demonstrate adjustable overvoltage, undervoltage, different current-limit types, and different current-limit thresholds.

Features

- 4.5V to 60V Operating-Voltage Range
- Features a TVS Diode across the Input and Schottky Diode across the Output Terminals
- Evaluates UVLO, OVLO, Three Current-Limit Types, and Current-Limit Threshold
- UVLO programmed to 4.5V
- OVLO programmed to 36V
- Jumper-Configurable Current-Limit (Selected as 0.1A by default)
- Current-Limit Mode Set To Autoretry by default
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Recommended Equipment

- MAX17608 EV kit
- 60V DC power supply
- Multimeters
- Adjustable load (0A-1.5A)
- USB-A male to USB-B male cable or 5V DC power supply

Equipment Setup and Test Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Verify that all jumpers are in their default positions.
- 2) Connect the USB cable to J1 from a computer or connect a 5V-DC power supply to TP3.
- 3) Verify that LED1 is on.
- 4) Set the 60V DC power supply to 5V and connect to IN (J2/TP6). Verify that OUT (J3/TP8) is 5V.
- 5) Gradually increase the DC power-supply voltage and verify that OUT voltage goes down and $\overline{UV\overline{OV}}$ goes low when input reaches approximately 36V.
- 6) Gradually decrease the DC power-supply voltage and verify that OUT comes back and $\overline{UV\overline{OV}}$ goes high when the input reaches approximately 34.8V.
- 7) Set the DC power-supply voltage to 24V and connect the adjustable load between OUT and GND terminals and a multimeter in series to measure the current. Gradually increase the load current and verify that the OUT goes down and $\overline{FLAG}$ goes low when the load current increases above 0.1A.
- 8) The jumper JU1 can be configured to change the current limit as given in [Table 2](#). Verify various current limit operations by repeating step 7.

CAUTION: When applying a negative input to V_{IN} , the negative input test should be performed when the output capacitors are fully discharged and V_{BUS} is not supplied.

MAX17608 Evaluation Kit

Evaluates: MAX17608 – 4.5V to 60V, 1A, OV, UV, Reverse-Voltage Protector with Forward/Reverse Current Limit

Detailed Description

The EV kit circuit can be configured to evaluate user-defined UVLO and OVLO thresholds using resistor-dividers. The overcurrent threshold is determined by external resistors connected to the SET1 pin and is jumper-configurable through jumper JU1. Using jumper JU4, the EV kit circuit can be configured to evaluate different current limit types (Autoretry, Continuous, and Latch-off). LED1 on the EV kit indicates availability of logic power for annunciation signals ($\overline{\text{UVOV}}$ and $\overline{\text{FLAG}}$) and EN.

The EV kit provides on-board output capacitors to enable a demonstration of the MAX17608 protection features.

Input-Power Supply

The EV kit is powered by a user-supplied 4.5V to 60V power supply connected between TP6 (INPUT POWER) and GND.

Enable

To enable the device, connect a USB-A male connector from the computer to the USB-B female connector, J1, or an external 5V supply to TP3 and GND. This provides 5V to V_{BUS} and to the EN pin (JU5 connects V_{BUS} to EN by default). Choose the JU5 setting to enable or disable operation of the MAX17608 (see [Table 1](#)).

UVLO/OVLO Threshold

Ensure jumper JU2 is installed to use the UVLO/OVLO resistive dividers.

The UVLO threshold for input voltage is set through the R9, R10 resistive divider. Use the following equation to calculate the value of R10 for a required undervoltage threshold level:

$$R10 = \frac{R9}{\left(\frac{V_{\text{UVLO}}}{V_{\text{REF}}} - 1\right)}$$

where R9 can be chosen as 2.2M Ω , V_{REF} is 1.5V, and V_{UVLO} is the required undervoltage protection threshold.

The OVLO threshold for input voltage is set through the R11, R12 resistive divider. Use the following equation to calculate the value of R12 for a required overvoltage threshold level:

$$R12 = \frac{R11}{\left(\frac{V_{\text{OVLO}}}{V_{\text{REF}}} - 1\right)}$$

where R11 can be chosen as 2.2M Ω , V_{REF} is 1.5V, and V_{OVLO} is the required overvoltage protection threshold.

Current-Limit Threshold

The EV kit features a jumper (JU1) to select the current-limit threshold. Install a jumper as shown in [Table 2](#) to change the current-limit threshold.

Table 1. Enable (JU5)

JUMPER	SHUNT POSITION	DESCRIPTION	MAX17608 STATUS
JU5	1-2*	EN pin connected to V_{BUS}	ON
	2-3	EN pin connected to GND	OFF
	Open	EN pin floating	ON

*Default position.

Table 2. Current-Limit Threshold (JU1)

JUMPER	SHUNT POSITION	DESCRIPTION
JU1	1-2*	Current limit 0.1A
	3-4	Current limit 0.5A
	5-6	Current limit 1.0A
	7-8	Current limit adjustable

*Default position.

MAX17608 Evaluation Kit

Evaluates: MAX17608 – 4.5V to 60V, 1A, OV, UV, Reverse-Voltage Protector with Forward/Reverse Current Limit

Current-Limit Type Select

The EV kit features jumper JU4 to select different current-limit responses. See [Table 3](#) for jumper settings.

Output-Load Capacitor

Use JU6 to connect the OUT pins to the OUT test point (TP8). Use jumper JU7 to connect output to 330 μ F capacitors. See [Table 4](#) for jumper settings

Table 3. Current-Limit Type Select (JU4)

JUMPER	SHUNT POSITION	DESCRIPTION
JU4	1-2	Latch-off
	2-3	Continuous
	Open*	Autoretry

*Default position.

Table 4. Output Load Capacitor (JU7)

JUMPER	SHUNT POSITION	DESCRIPTION
JU7	Installed	OUT connected to C4 and C5.
	Not installed*	OUT not connected to C4 and C5.

*Default position.
