

Half Bridge Gate Driver (Isolated High & Non-Isolated Low)

NCD57200

The NCD57200 is a high voltage gate driver with one non-isolated low side gate driver and one galvanically isolated high or low side gate driver. It can directly drive two IGBTs in a half bridge configuration. Isolated high side driver can be powered with an isolated power supply or with Bootstrap technique from the low side power supply.

The galvanic isolation for the high side gate driver guarantees reliable switching in high power applications for IGBTs that operate up to 800 V, at high dv/dt . The optimized output stages provide a mean of reducing IGBT losses. Its features include two independent inputs with deadtime and interlock, accurate asymmetric UVLOs, and short and matched propagation delays. The NCD57200 operates with its V_{DD}/V_{BS} up to 20 V.

Features

- High Peak Output Current (+1.9 A/–2.3 A)
- Low Output Voltage Drop for Enhanced IGBT Conduction
- Floating Channel for Bootstrap Operation up to +800 V
- CMTI up to 100 kV/ μ s
- Reliable Operation for V_S Negative Swing to –800 V
- V_{DD} & V_{BS} Supply Range up to 20 V
- 3.3 V, 5 V, and 15 V Logic Input
- Asymmetric Under Voltage Lockout Thresholds for High Side and Low Side
- Matched Propagation Delay 90 ns
- Built-in 20 ns Minimum Pulse Width Filter (or Input Noise Filter)
- Built-in 340 ns Dead-Time and High and Low Inputs Interlock
- Non-Inverting Output Signal
- This Device is Pb-Free, Halogen Free/BFR Free and is RoHS Compliant

Typical Applications

- Fans, Pumps
- Home Appliances
- Consumer Electronics
- General Purpose Half Bridge Applications

ORDERING INFORMATION

See detailed ordering and shipping information on page 15 of this data sheet.

NCD57200

Figure 1. Simplified Block Diagram

Figure 2. Simplified Application Schematics

Table 1. FUNCTION DESCRIPTION

Pin Name	No.	I/O	Description
V _{DD}	1	Power	Low side and main power supply. A good quality bypassing capacitor is required from this pin to GND and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than V _{UVLO1-OUT-ON} is present. Please see Figure 5 for more details. A filter time t _{UVF1} helps to suppress noise on V _{DD} pin.
HIN	2	I	High side non-inverting gate driver input. It has an equivalent pull-down resistor of 125 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative going pulse width is required at HIN before HO reacts. It adopts 3.3 V logic signal thresholds for input voltage up to V _{DD} . There is deadtime and interlocking logic between HIN and LIN.
LIN	3	I	Low side non-inverting gate driver input. It has an equivalent pull-down resistor of 125 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative going pulse width is required at LIN before LO reacts. It adopts 3.3 V logic signal thresholds for input voltage up to V _{DD} . There is deadtime and interlocking logic between HIN and LIN.
GND	4	Power	Logic ground and low side driver return.
LO	5	O	Low side driver output that provides the appropriate drive voltage and source/sink current to the IGBT gate. LO is actively pulled low during startup and under UVLO1 condition. There is deadtime and interlocking logic to prevent unintended HO and LO cross conduction.
V _S	6	Power	Bootstrap return or high side floating supply offset.
HO	7	O	Galvanically isolated high side driver output that provides the appropriate drive voltage and source/sink current to the IGBT gate. HO is actively pulled low during startup and under UVLOx condition. There is deadtime and interlocking logic to prevent unintended HO and LO cross conduction.
V _B	8	Power	Bootstrap or high side floating power supply. A good quality bypassing capacitor is required from this pin to V _S and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than V _{UVLO2-OUT-ON} is present. Please see Figure 5 for more details. A filter time t _{UVF2} helps to suppress noise on V _B pin.

Table 2. ABSOLUTE MAXIMUM RATINGS (Note 1) Over operating free-air temperature range unless otherwise noted

Parameter	Symbol	Minimum	Maximum	Unit
High-Side Offset Voltage (see Figure 2)	V_S	-900	900	V
High-Side Supply Voltage (see Figure 2)	V_B	-900	900	V
Low-Side Supply Voltage	V_{DD}	-0.3	25	V
High-Side Floating Supply Voltage	V_{BS}	-0.3	25	V
High-Side Output Voltage (HO) (see Figure 2)	V_{HO}	$V_S-0.3$	$V_{BS}+0.3$	V
Low-Side Output Voltage (LO)	V_{LO}	-0.3	$V_{DD}+0.3$	V
Logic Input Voltage (HIN, LIN)	V_{IN}	-0.3	$V_{DD}+0.3$	V
Allowable Offset Voltage Slew Rate (see Figure 32)	dV_S/dt		± 100	V/ns
Maximum Junction Temperature	$T_J(\max)$	-40	150	°C
Storage Temperature Range	TSTG	-65	150	°C
ESD Capability, Human Body Model (Note 2)	ESDHBM		± 4	kV
ESD Capability, Charged Device Model (Note 2)	ESDCDM		± 2	kV
Moisture Sensitivity Level	MSL		1	–
Lead Temperature Soldering Reflow	TSLD		260	°C
(SMD Styles Only), Pb-Free Versions (Note 3)				

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114).
ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101).
Latchup Current Maximum Rating: ≤ 100 mA per JEDEC standard: JESD78, 125°C.
3. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERM/D.

Table 3. THERMAL CHARACTERISTICS

Parameter	Symbol	Value	Unit
Thermal Characteristics, SOIC-8 (Note 4)	R θ JA	167	°C/W
Thermal Resistance, Junction-to-Air (Note 5)			

4. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
5. Values based on copper area of 100 mm² (or 0.16 in²) of 1 oz copper thickness and FR4 PCB substrate.

Table 4. RECOMMENDED OPERATING RANGES (Note 6)

Parameter	Symbol	Min	Max	Unit
High-Side Floating Supply Voltage	V_{BS}	$V_S+UVLO2$	V_S+20	V
High-Side Offset Voltage (see Figure 2)	V_S	-800	800	V
High-Side Output Voltage (HO) (see Figure 2)	V_{HO}	V_S	V_{BS}	V
Low-Side Output Voltage (LO)	V_{LO}	GND	V_{DD}	V
Logic Input Voltage (HIN, LIN)	V_{IN}	GND	V_{DD}	V
Low-Side Supply Voltage	V_{DD}	UVLO1	20	V
Ambient Temperature	T_A	-40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

NCD57200

Table 5. ELECTRICAL CHARACTERISTICS $V_{DD} = V_{BS} = 15\text{ V}$.

For typical values $T_A = 25^\circ\text{C}$, for min/max values, T_A is the operating ambient temperature range that applies, unless otherwise noted.

Parameter	Test Conditions	Symbol	Min	Typ	Max	Unit

Figure 28. UVLO Delay

Figure 29. Power Supply Current vs. Switching Frequency (Duty Cycle 50%)

Under Voltage Lockout (UVLO)

UVLO ensures correct switching of IGBT connected to the driver output.

- The IGBT is turned-off, if the supply V_{DD} drops below $V_{UVLO1-OUT-OFF}$ or V_{BS} drops below $V_{UVLO2-OUT-OFF}$
- The driver output does not start to react to the input signal on HIN or LIN until the V_{DD} or V_{BS} rises above the $V_{UVLOX-OUT-ON}$

Power Supply (V_{DD} , V_{BS})

NCD57200 is designed to support unipolar power supply on both individual channels.

For reliable high output current suitable external power capacitors are required. Parallel combination of 100 nF + 4.7 μ F ceramic capacitors is optimal for a wide range of applications using IGBT. For reliable driving of IGBT modules (containing several parallel IGBTs) a higher capacitance is required (typically 100 nF + 10 μ F). Capacitors should be as close as possible to the driver's power pins.

Power supply of isolated (HO) channel can be provided by an external DC power supply or Bootstrap circuit.

Figure 30. Unipolar Power Supply

Figure 31. Bootstrap Power Supply

Signal Inputs (HIN, LIN)

Inputs of NCD57200 are active high. Outputs are in phase with inputs signals respecting internal logic (see Figure 5, 6, 7).

WARNING: When the application uses an independent or separate power supply for the control unit on the input side of the driver, all inputs should be protected by a serial resistor (In case of a power failure of the driver, the driver may be damaged due to overloading of the input protection circuits).

Common Mode Transient Immunity (CMTI)

Figure 32. CMTI Test Setup

(Test Conditions: HV PULSE = ± 900 V, $dV/dt = 1\text{--}100$ V/ns, $V_{DD} = 15$ V, $V_B = 15$ V)

NOTE: Purple – recommended isolation gap.

ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. ON Semiconductor does not convey any license under its patent rights nor the rights of others.

ON Semiconductor and  are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
