

20 W + 20 W dual BTL class-D audio amplifier

PowerSSO-36
exposed pad up

PowerSSO-36 with
exposed pad down

Features

- 20 W + 20 W continuous output power:
 - $R_L = 8 \Omega$, THD = 10% at $V_{CC} = 18 \text{ V}$
- Wide-range single-supply operation (5 - 18 V)
- High efficiency ($\eta = 90\%$)
- Four selectable, fixed gain settings of nominally 20 dB, 26 dB, 30 dB and 32 dB
- Differential input minimize common-mode noise
- No 'pop' at turn-on/off
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- External synchronisation

Description

The [TDA7491HV](#) is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and exposed-pad-up (EPU) and down (EPD) packages, no separate heatsink is required.

The [TDA7491HV](#) is pin-to-pin compatible with the TDA7491P and TDA7491LP.

7 Application circuit

Figure 50. Application circuit for class-D amplifier

8 Application information

8.1 Mode selection

The three operating modes of the TDA7491HV are set by the two inputs, STBY (pin 20) and MUTE (pin 21).

- Standby mode: all circuits are turned off, very low current consumption.
- Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.
- Play mode: the amplifiers are active.

The protection functions of the TDA7491HV are enabled by pulling down the voltages of the STBY and MUTE inputs shown in figure below. The input current of the corresponding pins must be limited to 200 μ A.

Table 6. Mode settings

Mode	STBY	MUTE
Standby	L ⁽¹⁾	X (do not care)
Mute	H ⁽¹⁾	L
Play	H	H

1. Refer to V_{STBY} and V_{MUTE} in Section 4 Electrical specifications

Figure 51. Standby and mute circuits

Figure 52. Turn-on/off sequence for minimizing speaker “pop”

8.2 Gain setting

The gain of the TDA7491HV is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin31). Internally, the gain is set by changing the feedback resistors of the amplifier.

Table 7. Gain settings

GAIN0	GAIN1	Nominal gain, G_v (dB)
L ⁽¹⁾	H ⁽¹⁾	20
L	H	26
H	L	30
H	H	32

1. Refer to [Section 4 Electrical specifications](#) for L and H drive levels.

8.3 Input resistance and capacitance

The input impedance is set by an internal resistor $R_i = 68 \text{ k}\Omega$ (typical). An input capacitor (C_i) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in figure below. For $C_i = 220 \text{ nF}$, the high-pass filter cut-off frequency is below 20 Hz:

$$f_c = 1 / (2 * \pi * R_i * C_i)$$

Figure 53. Device input circuit and frequency response

8.4 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all the devices operate at the same clock frequency. This can be implemented by using one TDA7491HV as master clock, while the other devices are in slave mode, that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an output in master mode and an input in slave mode.

8.4.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency, f_{SW} , is controlled by the resistor, R_{OSC} , connected to pin ROSC:

$$f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4) \text{ kHz}$$

where R_{OSC} is in $\text{k}\Omega$.

In master mode, pin SYNCLK is used as a clock output pin whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly, then resistor R_{OSC} must be less than $60 \text{ k}\Omega$ as given below in [Table 8. How to set up SYNCLK.](#)

8.4.2 Slave mode (external clock)

In order to accept an external clock input the pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in table below.

The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

Table 8. How to set up SYNCLK

Mode	ROSC	SYNCLK
Master	$R_{OSC} < 60 \text{ k}\Omega$	Output
Slave	Floating (not connected)	Input

Figure 54. Master and slave connection

8.5 Modulation

The output modulation scheme of the BTL is called unipolar pulse width modulation (PWM).

The differential output voltages change between 0 V and $+V_{CC}$ and between 0 V and $-V_{CC}$.

This is in contrast to the traditional bipolar PWM outputs which change between $+V_{CC}$

and $-V_{CC}$. An advantage of this scheme is that it effectively doubles the switching frequency of the differential output waveform on the load then reducing the current ripple accordingly. The OUP and OUTN are in the same phase almost overlapped when the input is zero under this condition, then the switching current is low and the related losses in the load are low.

In practice, a short delay is introduced between these two outputs in order to avoid the BTL output switching simultaneously when the input is zero.

Figure below shows the resulting differential output voltage and current when a positive, zero and negative input signal is applied. The resulting differential voltage on the load has a double frequency with respect to outputs OUP and OUTN, resulting in reduced current ripple.

Figure 55. Unipolar PWM output

8.6 Reconstruction low-pass filter

Standard applications use a low-pass filter before the speaker. The cut-off frequency should be higher than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cut-off frequency of 27 kHz, are shown in figures below.

Figure 56. Typical LC filter for an 8 Ω speaker

Figure 57. Typical LC filter for an 4 Ω speaker

8.7 Protection functions

The TDA7491HV is fully protected against undervoltage, overcurrent and thermal overloads as explained here.

Undervoltage protection (UVP)

If the supply voltage drops below the value of V_{UVP} given in [Section 4 Electrical specifications](#) the undervoltage protection is active and forces the outputs to the high-impedance state. When the supply voltage recovers, the device restarts.

Overcurrent protection (OCP)

If the output current exceeds the value for I_{OCP} given in [Section 4 Electrical specifications](#), the overcurrent protection is active and forces the outputs to the high-impedance state. Periodically, the device tries to restart. If the overcurrent condition is still present then the OCP remains active. The restart time, T_{OC} , is determined by the R-C components connected to pin STBY.

Thermal protection (OTP)

If the junction temperature, T_j , reaches 145 °C (nominal), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. If the junction temperature reaches the value for T_j , given in [Section 4 Electrical specifications](#), the device shuts down and the output is forced to the high-impedance state. When the device cools sufficiently the device restarts.

8.8 Diagnostic output

The output pin DIAG is an open-drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (<18 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 μA) of the pin.

Figure 58. Behavior of pin DIAG for various protection conditions

8.9 Heatsink requirements

Due to the high efficiency of the class-D amplifier a 2-layer PCB can easily provide the heatsinking capability for low to medium power outputs. Using such a PCB with a copper ground layer of 3x3 cm² and 16 vias connecting it to the contact area for the exposed pad, a thermal resistance, junction-to-ambient (in natural air convection), of 24 °C/W can be achieved.

The dissipated power within the device depends primarily on the supply voltage, load impedance and output modulation level. With the TDA7491HV driving 2 x 8 Ω with a supply of 18 V then the device dissipation is approximately 4 W that gives with the above mentioned PCB a junction temperature rise of about 90 °C.

With a musical program, the dissipated power is about 40% less than the above maximum value. This leads to a junction temperature increase of around 60 °C. So even at the maximum recommended ambient temperature there is a margin of safety before the maximum junction temperature is reached.

Figure below shows the derating curves for copper areas of 4 cm² and 9 cm².

Figure 59. Power derating curves for PCB used as heatsink

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK®** packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

Revision history

Table 11. Document revision history

Date	Revision	Changes
02-Jul-2008	1	Initial release.
03-Oct-2008	2	Updated AMR table Updated Chapter 4: Characterization curves on page 12 Added Figure 48: Test board (TDA7491HV) layout on page 29 Updated Figure 49: PowerSSO-36 EPD outline drawing on page 30 and Table 6: PowerSSO-36 EPD dimensions on page 31 Updated Figure 50: Applications circuit for class-D amplifier on page 32
29-Jun-2009	3	Updated text concerning oscillator R and C in Section 3.3: Electrical specifications on page 10 Updated VOVP minimum value, added VUVP maximum value, updated STBY and MUTE voltages in Table 5: Electrical specifications on page 10 Updated equation for fSW Table 5 on page 10 Updated Figure 50: Applications circuit for class-D amplifier on page 32
03-Sep-2009	4	Added text for exposed pad in Figure 2 on page 8 Added text for exposed pad in Table 2 on page 9 Updated exposed pad Y (Min) dimension in Table 6 on page 31 Updated supply voltage for pin DIAG pull-up resistor in Section 7.8 on page 40.
24-Mar-2011	5	Updated Features Updated Section 3: Electrical specifications Removed filter less operation Extended the temperature range to -40 to +85°C.
12Sep-2011	6	Updated OUTNA in Table 2: Pin description list
20-Feb-2014	7	Updated order code Table 1 on page 1
04-Jul-2018	8	Added PowerSSO-36 EPU silhouette in cover page, Section 2.3 Pinout (EPU), Section 2.4 Pin list (EPU) and Section 9.2 PowerSSO-36 with exposed pad up.
05-Oct-2018	9	Updated product summary table in cover page.

Contents

1	Device block diagram	2
2	Pin description	3
2.1	Pinout (EPD)	3
2.2	Pin list (EPD)	4
2.3	Pinout (EPU)	5
2.4	Pin list (EPU)	6
3	Absolute maximum ratings	7
4	Electrical specifications	8
5	Characterization curves	10
5.1	4 Ω load at VCC = 14 V	10
5.2	6 Ω load at VCC = 16 V	15
5.3	8 Ω load at VCC = 18 V	22
6	Test board	31
7	Application circuit	32
8	Application information	33
8.1	Mode selection	33
8.2	Gain setting	34
8.3	Input resistance and capacitance	35
8.4	Internal and external clocks	35
8.4.1	Master mode (internal clock)	35
8.4.2	Slave mode (external clock)	36
8.5	Modulation	36
8.6	Reconstruction low-pass filter	37
8.7	Protection functions	38
8.8	Diagnostic output	38
8.9	Heatsink requirements	38
9	Package information	40
9.1	PowerSSO-36 exposed pad down	40
9.2	PowerSSO36 EPU package information	41

Revision history44

List of tables

Table 1.	Pin description list	4
Table 2.	Pin description list	6
Table 3.	Absolute maximum ratings	7
Table 4.	Thermal data	7
Table 5.	Electrical specifications	8
Table 6.	Mode settings	33
Table 7.	Gain settings	34
Table 8.	How to set up SYNCLK.	36
Table 9.	PowerSSO-36 EPD package dimensions	41
Table 10.	PowerSSO-36 EPU package mechanical data	43
Table 11.	Document revision history	44

List of figures

Figure 1.	Internal block diagram (showing one channel only)	2
Figure 2.	Pin connections (top view, PCB view)	3
Figure 3.	Pin connections (top view, PCB view)	5
Figure 4.	Output power vs. supply voltage	10
