

# MSP432P401R, MSP432P401M SimpleLink™ Mixed-Signal Microcontrollers

## 1 Device Overview

### 1.1 Features

- Core
  - Arm® 32-bit Cortex®-M4F CPU with floating-point unit and memory protection unit
  - Frequency up to 48 MHz
  - ULPBench™ benchmark:
    - 192.3 ULPMark™-CP
  - Performance benchmark:
    - 3.41 CoreMark/MHz
    - 1.22 DMIPS/MHz (Dhrystone 2.1)
- Advanced low-power analog features
  - SAR analog-to-digital converter (ADC) with 16-bit precision and up to 1 Msps
    - Differential and single-ended inputs
    - Two window comparators
    - Up to 24 input channels
  - Internal voltage reference with 10-ppm/°C typical stability
  - Two analog comparators
- Memories
  - Up to 256KB of flash main memory (organized into two banks enabling simultaneous read or execute during erase)
  - 16KB of flash information memory (used for BSL, TLV, and flash mailbox)
  - Up to 64KB of SRAM (including 6KB of backup memory)
  - 32KB of ROM with MSP432™ peripheral driver libraries
- Ultra-low-power operating modes
  - Active: 80 µA/MHz
  - Low-frequency active: 83 µA at 128 kHz
  - LPM3 (with RTC): 660 nA
  - LPM3.5 (with RTC): 630 nA
  - LPM4: 500 nA
  - LPM4.5: 25 nA
- Development kits and software (see [Tools and Software](#))
  - [MSP-EXP432P401R LaunchPad™ Development Kit](#)
  - [MSP-TS432PZ100 100-Pin Target Board](#)
  - [SimpleLink™ MSP432 Software Development Kit \(SDK\)](#)
- Operating characteristics
  - Wide supply voltage range: 1.62 V to 3.7 V
  - Temperature range (ambient): –40°C to 85°C
- Flexible clocking features
  - Tunable internal DCO (up to 48 MHz)
  - 32.768-kHz low-frequency crystal support (LFXT)
  - High-frequency crystal support (HFXT) up to 48 MHz
  - Low-frequency internal reference oscillator (REFO)
  - Very low-power low-frequency internal oscillator (VLO)
  - Module oscillator (MODOSC)
  - System oscillator (SYSOSC)
- Code security features
  - JTAG and SWD lock
  - IP protection (up to four secure flash zones, each with configurable start address and size)
- Enhanced system features
  - Programmable supervision and monitoring of supply voltage
  - Multiple-class resets for better control of application and debug
  - 8-channel DMA
  - RTC with calendar and alarm functions
- Timing and control
  - Up to four 16-bit timers, each with up to five capture, compare, PWM capability
  - Two 32-bit timers, each with interrupt generation capability
- Serial communication
  - Up to four eUSCI\_A modules
    - UART with automatic baud-rate detection
    - IrDA encode and decode
    - SPI (up to 16 Mbps)
  - Up to four eUSCI\_B modules
    - I²C (with multiple-slave addressing)
    - SPI (up to 16 Mbps)
- Flexible I/O features
  - Ultra-low-leakage I/Os (±20 nA maximum)
  - All I/Os with capacitive-touch capability
  - Up to 48 I/Os with interrupt and wake-up capability
  - Up to 24 I/Os with port mapping capability
  - Eight I/Os with glitch filtering capability

- Encryption and data integrity accelerators
  - 128-, 192-, or 256-bit AES encryption and decryption accelerator
  - 32-bit hardware CRC engine
- JTAG and debug support
  - 4-pin JTAG and 2-pin SWD debug interfaces
  - Serial wire trace
  - Power debug and profiling of applications

## 1.2 Applications

- Industrial and automation
  - Glass breakage detectors
  - Smart thermostats
  - Access panels
  - Gas monitors
  - Field transmitters
  - Process automation
  - Home automation
- Metering
  - Flow meters
  - Electric meters
  - Communication modules
- Test and measurement
  - Digital multimeters
  - Wireless digital multimeters
  - Contactless and hand-held digital meters
- Health and fitness
  - Watches
  - Activity monitors
  - Fitness accessories
  - Blood glucose meters
- Consumer electronics
  - Mobile devices
  - Sensor hubs

## 1.3 Description

The SimpleLink MSP432P401x microcontrollers (MCUs) are optimized wireless host MCUs with an integrated 16-bit precision ADC, delivering ultra-low-power performance including 80  $\mu$ A/MHz in active power and 660 nA in standby power with FPU and DSP extensions. As an optimized wireless host MCU, the MSP432P401x allows developers to add high-precision analog and memory extension to applications based on [SimpleLink wireless connectivity solutions](#).

The MSP432P401x devices are part of the SimpleLink microcontroller (MCU) platform, which consists of Wi-Fi®, Bluetooth® low energy, Sub-1 GHz, and host MCUs. All share a common, easy-to-use development environment with a single core software development kit (SDK) and rich tool set. A one-time integration of the SimpleLink platform lets you add any combination of devices from the portfolio into your design. The ultimate goal of the SimpleLink platform is to achieve 100 percent code reuse when your design requirements change. For more information, visit [www.ti.com/simplelink](http://www.ti.com/simplelink).

MSP432P401x devices are supported by a comprehensive ecosystem of tools, software, documentation, training, and support to get your development started quickly. The MSP-EXP432P401R LaunchPad development kit or MSP-TS432PZ100 target socket board (with additional MCU sample) along with the free SimpleLink MSP432 SDK is all you need to get started.

**Device Information<sup>(1)</sup>**

| PART NUMBER                        | PACKAGE    | BODY SIZE <sup>(2)</sup> |
|------------------------------------|------------|--------------------------|
| MSP432P401RIPZ<br>MSP432P401MIPZ   | LQFP (100) | 14 mm × 14 mm            |
| MSP432P401RIZXH<br>MSP432P401MIZXH | NFBGA (80) | 5 mm × 5 mm              |
| MSP432P401RIRGC<br>MSP432P401MIRGC | VQFN (64)  | 9 mm × 9 mm              |

(1) For the most current part, package, and ordering information for all available devices, see the *Package Option Addendum* in [Section 9](#), or see the [TI website](#).

(2) The sizes shown here are approximations. For the package dimensions with tolerances, see the *Mechanical Data* in [Section 9](#).

## 1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the MSP432P401R and MSP432P401M devices.

**Figure 1-1. MSP432P401R, MSP432P401M Functional Block Diagram**

The CPU and all of the peripherals in the device interact with each other through a common AHB matrix. In some cases, there are bridges between the AHB ports and the peripherals. These bridges are transparent to the application from a memory map perspective and, therefore, are not shown in the block diagram.

## Table of Contents

### 3 Device Comparison

Table 3-1 summarizes the features of the MSP432P401x microcontrollers.

**Table 3-1. Device Comparison<sup>(1)</sup>**

| DEVICE          | FLASH (KB) | SRAM (KB) | Precision ADC (Channels) | COMP_E0 (Channels) | COMP_E1 (Channels) | Timer_A <sup>(2)</sup> | eUSCI_A: UART, IrDA, SPI | eUSCI_B: SPI, I <sup>2</sup> C | 20-mA DRIVE I/O | TOTAL I/Os | PACKAGE |
|-----------------|------------|-----------|--------------------------|--------------------|--------------------|------------------------|--------------------------|--------------------------------|-----------------|------------|---------|
| MSP432P401RIPZ  | 256        | 64        | 24 ext, 2 int            | 8                  | 8                  | 5, 5, 5, 5             | 4                        | 4                              | 4               | 84         | 100 PZ  |
| MSP432P401MIPZ  | 128        | 32        | 24 ext, 2 int            | 8                  | 8                  | 5, 5, 5, 5             | 4                        | 4                              | 4               | 84         | 100 PZ  |
| MSP432P401RIZXH | 256        | 64        | 16 ext, 2 int            | 6                  | 8                  | 5, 5, 5                | 3                        | 4                              | 4               | 64         | 80 ZXH  |
| MSP432P401MIZXH | 128        | 32        | 16 ext, 2 int            | 6                  | 8                  | 5, 5, 5                | 3                        | 4                              | 4               | 64         | 80 ZXH  |
| MSP432P401RIRGC | 256        | 64        | 12 ext, 2 int            | 2                  | 4                  | 5, 5, 5                | 3                        | 3                              | 4               | 48         | 64 RGC  |
| MSP432P401MIRGC | 128        | 32        | 12 ext, 2 int            | 2                  | 4                  | 5, 5, 5                | 3                        | 3                              | 4               | 48         | 64 RGC  |

(1) For the most current part, package, and ordering information for all available devices, see the *Package Option Addendum* in [Section 9](#), or see the TI website at [www.ti.com](http://www.ti.com).

(2) Each number in the sequence represents an instantiation of Timer\_A with its associated number of capture/compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer\_A, the first instantiation having 3 and the second instantiation having 5 capture/compare registers and PWM output generators, respectively.

#### 3.1 Related Products

For information about other devices in this family of products or related products, see the following links.

**TI 16-bit and 32-bit microcontrollers** High-performance, low-power solutions to enable the autonomous future

**Products for SimpleLink wired MCUs** From precision sensors to intelligent gateway to cloud

**Companion products for MSP432P401R** Review products that are frequently purchased or used with this product.

**Reference designs for MSP432P401R** Find reference designs that leverage the best in TI technology to solve your system-level challenges.

## 4 Terminal Configuration and Functions

### 4.1 Pin Diagrams

Figure 4-1 shows the pinout of the 100-pin PZ package.

- The secondary digital functions on Ports P2, P3, and P7 are fully mappable. This pinout shows only the default mapping. See [Section 6.9.2](#) for details.
- A glitch filter is implemented on these digital I/Os: P1.0, P1.4, P1.5, P3.0, P3.4, P3.5, P6.6, P6.7.
- UART BSL pins: P1.2 - BSLRXD, P1.3 - BSLTXD
- SPI BSL pins: P1.4 - BSLSTE, P1.5 - BSLCLK, P1.6 - BSLSIMO, P1.7 - BSLSOMI
- I<sup>2</sup>C BSL pins: P3.6 - BSLSDA, P3.7 - BSLSCL

**Figure 4-1. 100-Pin PZ Package (Top View)**

Figure 4-2 shows the pinout of the 80-pin ZXH package.

- A. A glitch filter is implemented on these digital I/Os: P1.0, P1.4, P1.5, P3.0, P3.4, P3.5, P6.6, P6.7.
- B. UART BSL pins: P1.2 - BSLRXD, P1.3 - BSLTXD
- C. SPI BSL pins: P1.4 - BSLSTE, P1.5 - BSLCLK, P1.6 - BSLSIMO, P1.7 - BSLSOMI
- D. I<sup>2</sup>C BSL pins: P3.6 - BSLSDA, P3.7 - BSLSCL

**Figure 4-2. 80-Pin ZXH Package (Top View)**

Figure 4-3 shows the pinout of the 64-pin RGC package.

- A. The secondary digital functions on Ports P2, P3, and P7 are fully mappable. This pinout shows only the default mapping. See [Section 6.9.2](#) for details.
- B. A glitch filter is implemented on these digital I/Os: P1.0, P1.4, P1.5, P3.0, P3.4, P3.5, P6.6, P6.7.
- C. TI recommends connecting the thermal pad on the QFN package to DVSS.
- D. UART BSL pins: P1.2 - BSLRXD, P1.3 - BSLTXD
- E. SPI BSL pins: P1.4 - BSLSTE, P1.5 - BSLCLK, P1.6 - BSLSIMO, P1.7 - BSLSOMI
- F. I<sup>2</sup>C BSL pins: P3.6 - BSLSDA, P3.7 - BSLSCL

**Figure 4-3. 64-Pin RGC Package (Top View)**

## 4.2 Pin Attributes

Table 4-1 describes the attributes of the pins.

**Table 4-1. Pin Attributes**

| PIN NO. <sup>(1)</sup> |     |     | SIGNAL NAME <sup>(2) (3)</sup> | SIGNAL TYPE <sup>(4)</sup> | BUFFER TYPE <sup>(5)</sup> | POWER SOURCE <sup>(6)</sup> | RESET STATE AFTER POR <sup>(7)</sup> |
|------------------------|-----|-----|--------------------------------|----------------------------|----------------------------|-----------------------------|--------------------------------------|
| PZ                     | ZXH | RGC |                                |                            |                            |                             |                                      |
| 1                      | N/A | N/A | P10.1 (RD)                     | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |
|                        |     |     | UCB3CLK                        | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
| 2                      | N/A | N/A | P10.2 (RD)                     | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |
|                        |     |     | UCB3SIMO                       | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
|                        |     |     | UCB3SDA                        | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
| 3                      | N/A | N/A | P10.3 (RD)                     | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |
|                        |     |     | UCB3SOMI                       | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
|                        |     |     | UCB3SCL                        | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
| 4                      | A1  | 1   | P1.0 (RD)                      | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |
|                        |     |     | UCA0STE                        | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
| 5                      | B1  | 2   | P1.1 (RD)                      | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |
|                        |     |     | UCA0CLK                        | I/O                        | LVC MOS                    | DVCC                        | N/A                                  |
| 6                      | C4  | 3   | P1.2 (RD)                      | I/O                        | LVC MOS                    | DVCC                        | OFF                                  |

(1) N/A = not available on this package

(2) (RD) indicates the reset default signal name for that pin.

(3) To determine the pin mux encodings for each pin, see [Section 6.12](#).

(4) Signal Types: I = Input, O = Output, I/O = Input or Output, P = power

(5) Buffer Types: see [Table 4-3](#) for details

(6) The power source shown in this table is the I/O power source, which may differ from the module power source.

(7) Reset States:

OFF = High-impedance with Schmitt trigger and pullup or pulldown (if available) disabled

PD = High-impedance input with pulldown enabled

PU = High-impedance input with pullup enabled

N/A = Not applicable

**Table 4-1. Pin Attributes (continued)**

|          | UCA3TXD     | 99                        | N/A | N/A | O                          | Transmit data – eUSCI_A3 UART mode                            |

## 4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and diagrams of the multiplexed ports, see [Section 6.12](#).

## 4.5 Buffer Types

[Table 4-3](#) describes the buffer types that are referenced in [Table 4-1](#).

**Table 4-3. Buffer Type**

| BUFFER TYPE (STANDARD)               | NOMINAL VOLTAGE | HYSTERESIS       | PU OR PD     | NOMINAL PU OR PD STRENGTH ( $\mu$ A) | OUTPUT DRIVE STRENGTH (mA)           | OTHER CHARACTERISTICS                                    |
|--------------------------------------|-----------------|------------------|--------------|--------------------------------------|--------------------------------------|----------------------------------------------------------|
| Analog <sup>(1)</sup>                | 3.0 V           | N                | N/A          | N/A                                  | N/A                                  | See analog modules in <i>Specifications</i> for details. |
| HVCMOS                               | 13.0 V          | Y                | N/A          | N/A                                  | See <i>Typical Characteristics</i> . |                                                          |
| LVC MOS                              | 3.0 V           | Y <sup>(2)</sup> | Programmable | See <i>General-Purpose I/Os</i> .    | See <i>Typical Characteristics</i> . |                                                          |
| Power (DVCC) <sup>(3)</sup>          | 3.0 V           | N                | N/A          | N/A                                  | N/A                                  | SVSMH enables hysteresis on DVCC.                        |
| Power (AVCC) <sup>(3)</sup>          | 3.0 V           | N                | N/A          | N/A                                  | N/A                                  |                                                          |
| Power (DVSS and AVSS) <sup>(3)</sup> | 0 V             | N                | N/A          | N/A                                  | N/A                                  |                                                          |

(1) This is a switch, not a buffer.

(2) Only for input pins

(3) This is supply input, not a buffer.

## 4.6 Connection for Unused Pins

[Table 4-4](#) lists the correct termination of all unused pins.

**Table 4-4. Connection for Unused Pins<sup>(1)</sup>**

| PIN          | POTENTIAL                           | COMMENT                                                                                                                                                                                                                          |
|--------------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVCC         | DV <sub>CC</sub>                    |                                                                                                                                                                                                                                  |
| AVSS         | DV <sub>SS</sub>                    |                                                                                                                                                                                                                                  |
| VSW          | Open                                | Leave VSW pin unconnected if DC-DC regulator operation is not required.                                                                                                                                                          |
| Px.0 to Px.7 | Open                                | Set to port function in output direction, and leave unconnected.                                                                                                                                                                 |
| RSTn/NMI     | DV <sub>CC</sub> or V <sub>CC</sub> | 47-k $\Omega$ pullup with 1.1-nF pulldown.                                                                                                                                                                                       |
| PJ.4/TDI     | Open                                | The JTAG TDI pin is shared with general-purpose I/O function (PJ.4). If not being used, this pin should be set to port function in the output direction. When used as JTAG TDI pin, it should remain open.                       |
| PJ.5/TDO/SWO | DV <sub>CC</sub> or V <sub>CC</sub> | The JTAG TDO/SWO pin is shared with general-purpose I/O function (PJ.5). If not being used, this pin should be set to port function in the output direction. When used as JTAG TDO/SWO pin, it should be pulled down externally. |
| SWDIOTMS     | DV <sub>CC</sub> or V <sub>CC</sub> | This pin should be pulled up externally.                                                                                                                                                                                         |
| SWCLKTCK     | DV <sub>SS</sub> or V <sub>SS</sub> | This pin should be pulled down externally.                                                                                                                                                                                       |

(1) For any unused pin with a secondary function that is shared with general-purpose I/O, follow the guidelines for the Px.0 to Px.7 pins.

## 5 Specifications

### 5.1 Absolute Maximum Ratings<sup>(1)</sup>

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

|                                                              | MIN  | MAX                                     | UNIT |
|--------------------------------------------------------------|------|-----------------------------------------|------|
| Voltage applied at DVCC and AVCC pins to V <sub>SS</sub>     | −0.3 | 4.17                                    | V    |
| Voltage difference between DVCC and AVCC pins <sup>(2)</sup> |      | ±0.3                                    | V    |
| Voltage applied to any pin <sup>(3)</sup>                    | −0.3 | V <sub>CC</sub> + 0.3 V<br>(4.17 V MAX) | V    |
| Diode current at any device pin                              |      | ±2                                      | mA   |
| Storage temperature, T <sub>stg</sub> <sup>(4)</sup>         | −40  | 125                                     | °C   |
| Maximum junction temperature, T <sub>J</sub>                 |      | 95                                      | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Voltage differences between DVCC and AVCC exceeding the specified limits may cause malfunction of the device.
- (3) All voltages referenced to V<sub>SS</sub>.
- (4) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

### 5.2 ESD Ratings

|                                            |                                                                                | VALUE | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup> (2)          | ±1000 | V    |
|                                            | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(3)</sup> | ±250  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) All pins except DVSS3 pass HBM up to ±1000 V. The DVSS3 pin is used for TI internal test purposes. Connect the DVSS3 pin to supply ground on the customer application board.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

### 5.3 Recommended Operating Conditions

Typical data are based on V<sub>CC</sub> = 3.0 V, T<sub>A</sub> = 25°C (unless otherwise noted)

|                                                                                       |                                                               | MIN  | NOM | MAX | UNIT |
|---------------------------------------------------------------------------------------|---------------------------------------------------------------|------|-----|-----|------|
| V <sub>CC</sub> Supply voltage range at all DVCC and AVCC pins <sup>(1)</sup> (2) (3) | At power-up (with internal V <sub>CC</sub> supervision)       | 1.71 |     | 3.7 | V    |
|                                                                                       | Normal operation with internal V <sub>CC</sub> supervision    | 1.71 |     | 3.7 |      |
|                                                                                       | Normal operation without internal V <sub>CC</sub> supervision | 1.62 |     | 3.7 |      |
| V <sub>SS</sub> Supply voltage on all DVSS and AVSS pins                              |                                                               |      | 0   |     | V    |
| I <sub>INRUSH</sub> Inrush current into the V <sub>CC</sub> pins <sup>(4)</sup>       |                                                               |      |     | 100 | mA   |
| f <sub>MCLK</sub> Frequency of the CPU and AHB clock in the system <sup>(5)</sup>     |                                                               | 0    |     | 48  | MHz  |
| T <sub>A</sub> Operating free-air temperature                                         |                                                               | −40  |     | 85  | °C   |
| T <sub>J</sub> Operating junction temperature                                         |                                                               | −40  |     | 85  | °C   |

- (1) TI recommends powering AV<sub>CC</sub> and DV<sub>CC</sub> from the same source. A maximum difference of ±0.1 V between AV<sub>CC</sub> and DV<sub>CC</sub> can be tolerated during power up and operation. See [Section 5.4](#) for decoupling capacitor recommendations.
- (2) Supply voltage must not change faster than 1 V/ms. Faster changes can cause the VCCDET to trigger a reset even within the recommended supply voltage range.
- (3) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
- (4) Does not include I/O currents (driven by application requirements).
- (5) Operating frequency may require the flash to be accessed with wait states. See [Section 5.8](#) for further details.

## 5.4 Recommended External Components<sup>(1) (2) (3)</sup>

|                                  |                                                           |                                                       | MIN  | TYP | MAX  | UNIT |
|----------------------------------|-----------------------------------------------------------|-------------------------------------------------------|------|-----|------|------|
| C <sub>DVCC</sub>                | Capacitor on DVCC pin                                     | For DC-DC operation <sup>(4)</sup>                    | 3.3  | 4.7 |      | μF   |
|                                  |                                                           | For LDO-only operation                                | 3.3  | 4.7 |      |      |
| C <sub>VCORE</sub>               | Capacitor on V <sub>CORE</sub> pin                        | For DC-DC operation, including capacitor tolerance    | 1.54 | 4.7 | 9    | μF   |
|                                  |                                                           | For LDO-only operation, including capacitor tolerance | 70   | 100 | 9000 | nF   |
| C <sub>AVCC</sub>                | Capacitor on AVCC pin                                     |                                                       | 3.3  | 4.7 |      | μF   |
| L <sub>VSW</sub>                 | Inductor between VSW and V <sub>CORE</sub> pins for DC-DC |                                                       | 3.3  | 4.7 | 13   | μH   |
| R <sub>LVS<sub>W</sub>-DCR</sub> | Allowed DCR for L <sub>VSW</sub>                          |                                                       |      | 150 | 350  | mΩ   |
| I <sub>SAT-LVSW</sub>            | L <sub>VSW</sub> saturation current                       |                                                       | 700  |     |      | mA   |

- (1) For optimum performance, select the component value to match the typical value given in the table.  
 (2) See the section on board guidelines for further details on component selection, placement as well as related PCB design guidelines.  
 (3) Tolerance of the capacitance and inductance values should be taken into account when choosing a component, to ensure that the MIN and MAX limits are never exceeded.  
 (4) C<sub>DVCC</sub> should not be smaller than C<sub>VCORE</sub>.

## 5.5 Operating Mode V<sub>CC</sub> Ranges

over operating free-air temperature (unless otherwise noted)

| PARAMETER                                | OPERATING MODE                                                                                             | TEST CONDITIONS                                                                                     | MIN  | MAX | UNIT |

|                                          |                                                                                                            | LDO disabled, SVSMH enabled                                                                         | 1.71 | 3.7 |      |

- (1) Flash remains active **only** in active modes and LPM0 modes.  
 (2) Low-frequency active, low-frequency LPM0, LPM3, LPM4, and LPM3.5 modes are based on LDO **only**.  
 (3) When V<sub>CC</sub> falls below the specified MIN value, the DC-DC operation switches to LDO automatically, as long as the V<sub>CC</sub> drop is slower than the rate that is reliably detected. See [Table 5-20](#) for more details.  
 (4) Core voltage is off in LPM4.5 mode.

## 5.6 Operating Mode CPU Frequency Ranges<sup>(1)</sup>

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER              | OPERATING MODE | DESCRIPTION                                                | $f_{MCLK}$ |     | UNIT |
|------------------------|----------------|------------------------------------------------------------|------------|-----|------|
|                        |                |                                                            | MIN        | MAX |      |
| $f_{AM\_LDO\_VCORE0}$  | AM_LDO_VCORE0  | Normal performance mode with LDO as the active regulator   | 0          | 24  | MHz  |
| $f_{AM\_LDO\_VCORE1}$  | AM_LDO_VCORE1  | High performance mode with LDO as the active regulator     | 0          | 48  | MHz  |
| $f_{AM\_DCDC\_VCORE0}$ | AM_DCDC_VCORE0 | Normal performance mode with DC-DC as the active regulator | 0          | 24  | MHz  |
| $f_{AM\_DCDC\_VCORE1}$ | AM_DCDC_VCORE1 | High performance mode with DC-DC as the active regulator   | 0          | 48  | MHz  |
| $f_{AM\_LF\_VCORE0}$   | AM_LF_VCORE0   | Low-frequency mode with LDO as the active regulator        | 0          | 128 | kHz  |
| $f_{AM\_LF\_VCORE1}$   | AM_LF_VCORE1   | Low-frequency mode with LDO as the active regulator        | 0          | 128 | kHz  |

(1) DMA can be operated at the same frequency as CPU.

## 5.7 Operating Mode Peripheral Frequency Ranges

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER              | OPERATING MODE   | DESCRIPTION                                                                                          | MIN | MAX    | UNIT |
|------------------------|------------------|------------------------------------------------------------------------------------------------------|-----|--------|------|
| $f_{AM\_LPM0\_VCORE0}$ | AM_LDO_VCORE0    | Peripheral frequency range in LDO or DC-DC based active or LPM0 modes for VCORE0                     | 0   | 12     | MHz  |
|                        | AM_DCDC_VCORE0   |                                                                                                      |     |        |      |
|                        | LPM0_LDO_VCORE0  |                                                                                                      |     |        |      |
|                        | LPM0_DCDC_VCORE0 |                                                                                                      |     |        |      |
| $f_{AM\_LPM0\_VCORE1}$ | AM_LDO_VCORE1    | Peripheral frequency range in LDO or DC-DC based active or LPM0 modes for VCORE1                     | 0   | 24     | MHz  |
|                        | AM_DCDC_VCORE1   |                                                                                                      |     |        |      |
|                        | LPM0_LDO_VCORE1  |                                                                                                      |     |        |      |
|                        | LPM0_DCDC_VCORE1 |                                                                                                      |     |        |      |
| $f_{AM\_LPM0\_LF}$     | AM_LF_VCORE0     | Peripheral frequency range in low-frequency active or low frequency LPM0 modes for VCORE0 and VCORE1 | 0   | 128    | kHz  |
|                        | AM_LF_VCORE1     |                                                                                                      |     |        |      |
|                        | LPM0_LF_VCORE0   |                                                                                                      |     |        |      |
|                        | LPM0_LF_VCORE1   |                                                                                                      |     |        |      |
| $f_{LPM3}^{(1)}$       | LPM3_VCORE0      | Peripheral frequency in LPM3 mode for VCORE0 and VCORE1                                              | 0   | 32.768 | kHz  |
|                        | LPM3_VCORE1      |                                                                                                      |     |        |      |
| $f_{LPM3.5}^{(1)}$     | LPM3.5           | Peripheral frequency in LPM3.5 mode                                                                  | 0   | 32.768 | kHz  |

(1) Only RTC and WDT can be active.

## 5.8 Operating Mode Execution Frequency vs Flash Wait-State Requirements

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                    | NUMBER OF FLASH WAIT STATES | FLASH READ MODE                 | MAXIMUM SUPPORTED MCLK FREQUENCY <sup>(1) (2)</sup> |                                  | UNIT |
|------------------------------|-----------------------------|---------------------------------|-----------------------------------------------------|----------------------------------|------|
|                              |                             |                                 | AM_LDO_VCORE0,<br>AM_DCDC_VCORE0                    | AM_LDO_VCORE1,<br>AM_DCDC_VCORE1 |      |
| f <sub>MAX_NRM_FLWAIT0</sub> | 0                           | Normal read mode                | 16                                                  | 24                               | MHz  |
| f <sub>MAX_NRM_FLWAIT1</sub> | 1                           | Normal read mode                | 24                                                  | 48                               | MHz  |
| f <sub>MAX_ORM_FLWAIT0</sub> | 0                           | Other read modes <sup>(3)</sup> | 8                                                   | 12                               | MHz  |
| f <sub>MAX_ORM_FLWAIT1</sub> | 1                           | Other read modes <sup>(3)</sup> | 16                                                  | 24                               | MHz  |
| f <sub>MAX_ORM_FLWAIT2</sub> | 2                           | Other read modes <sup>(3)</sup> | 24                                                  | 36                               | MHz  |
| f <sub>MAX_ORM_FLWAIT3</sub> | 3                           | Other read modes <sup>(3)</sup> | 24                                                  | 48                               | MHz  |

- (1) Violation of the maximum frequency limitation for a given wait-state configuration results in nondeterministic data or instruction fetches from the flash memory.
- (2) In low-frequency active modes, the flash can always be accessed with zero wait states, because the maximum MCLK frequency is limited to 128 kHz.
- (3) Other read modes refers to Read Margin 0, Read Margin 1, Program Verify, and Erase Verify.

## 5.9 Current Consumption During Device Reset of the 100-pin LQFP Package

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)<sup>(1) (2)(3) (4) (5)</sup>

| PARAMETER          |                             | V <sub>CC</sub> | MIN | TYP | MAX | UNIT |
|--------------------|-----------------------------|-----------------|-----|-----|-----|------|
| I <sub>RESET</sub> | Current during device reset | 2.2 V           |     | 510 |     | μA   |
|                    |                             | 3.0 V           |     | 600 | 850 |      |

- (1) This parameter does not apply to the 64-pin VQFN package.
- (2) This parameter does not apply to the 80-pin NFBGA package.
- (3) Device held in reset through RSTn/NMI pin.
- (4) Current measured into V<sub>CC</sub>.
- (5) All other input pins tied to 0 V or V<sub>CC</sub>. Outputs do not source or sink any current.

## 5.10 Current Consumption in LDO-Based Active Modes – Dhrystone 2.1 Program

over recommended operating free-air temperature (unless otherwise noted)<sup>(1) (2) (3) (4) (5)</sup>

| PARAMETER                                               | EXECUTION MEMORY | V <sub>CC</sub> | MCLK = 1 MHz |     | MCLK = 8 MHz |      | MCLK = 16 MHz |      | MCLK = 24 MHz |      | MCLK = 32 MHz |      | MCLK = 40 MHz |      | MCLK = 48 MHz |      | UNIT |
|---------------------------------------------------------|------------------|-----------------|--------------|-----|--------------|------|---------------|------|---------------|------|---------------|------|---------------|------|---------------|------|------|

(1) Current measured into V<sub>CC</sub>.

(2) All other input pins tied to 0 V or V<sub>CC</sub>. Outputs do not source or sink any current.

(3) CPU is off, and flash is powered down.

(4) Bank 0 of SRAM is retained, all other banks are powered down.

(5) See [Table 5-48](#) for details on additional current consumed for each extra Bank that is enabled for retention.

(6) SVSMH is disabled.

(7) RTC is sourced by LFXT. Effective load capacitance of LF crystal is 3.7 pF.

(8) WDT module is disabled.

(9) RTC is sourced by REFO.

(10) RTC and WDT modules are disabled.

## 5.22 Current Consumption in LPM3.5, LPM4.5 Modes

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)<sup>(1) (2)</sup>

| PARAMETER                                                  | V <sub>CC</sub> | –40°C |     | 25°C |     | 60°C |     | 85°C |     | UNIT |

| Ψ <sub>JT</sub>                | Junction-to-top thermal characterization parameter               |                | 0.2                  | °C/W |
| R <sub>θJC(BOTTOM)</sub>       | Junction-to-case (bottom) thermal resistance <sup>(6)</sup>      |                | N/A                  | °C/W |
| R <sub>θJA</sub>               | Junction-to-ambient thermal resistance, still air <sup>(3)</sup> | NFBGA-80 (ZXH) | 58.1                 | °C/W |
| R <sub>θJC(TOP)</sub>          | Junction-to-case (top) thermal resistance <sup>(4)</sup>         |                | 26.1                 | °C/W |
| R <sub>θJB</sub>               | Junction-to-board thermal resistance <sup>(5)</sup>              |                | 22.6                 | °C/W |
| Ψ <sub>JB</sub>                | Junction-to-board thermal characterization parameter             |                | 22.0                 | °C/W |
| Ψ <sub>JT</sub>                | Junction-to-top thermal characterization parameter               |                | 0.5                  | °C/W |
| R <sub>θJC(BOTTOM)</sub>       | Junction-to-case (bottom) thermal resistance <sup>(6)</sup>      |                | N/A                  | °C/W |
| R <sub>θJA</sub>               | Junction-to-ambient thermal resistance, still air <sup>(3)</sup> | VQFN-64 (RGC)  | 29.4                 | °C/W |
| R <sub>θJC(TOP)</sub>          | Junction-to-case (top) thermal resistance <sup>(4)</sup>         |                | 14.8                 | °C/W |
| R <sub>θJB</sub>               | Junction-to-board thermal resistance <sup>(5)</sup>              |                | 8.3                  | °C/W |
| Ψ <sub>JB</sub>                | Junction-to-board thermal characterization parameter             |                | 8.2                  | °C/W |
| Ψ <sub>JT</sub>                | Junction-to-top thermal characterization parameter               |                | 0.2                  | °C/W |
| R <sub>θJC(BOTTOM)</sub>       | Junction-to-case (bottom) thermal resistance <sup>(6)</sup>      |                | 1.0                  | °C/W |

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

(2) N/A = not applicable

(3) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.

(4) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(5) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(6) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## 5.25 Timing and Switching Characteristics

### 5.25.1 Reset Timing

Table 5-1 lists the latencies to recover from different types of resets.

**Table 5-1. Reset Recovery Latencies**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) <sup>(1)</sup>

| PARAMETER                       |                                                                                                    | MIN | TYP | MAX | UNIT        |
|---------------------------------|----------------------------------------------------------------------------------------------------|-----|-----|-----|-------------|
| $t_{SOFT}$                      | Latency from release of soft reset to first CPU instruction fetch                                  |     | 5   |     | MCLK cycles |
| $t_{HARD}$                      | Latency from release of hard reset to release of soft reset                                        |     | 25  |     | MCLK cycles |
| $t_{POR}$                       | Latency from release of device POR to release of hard reset                                        |     | 15  | 25  | $\mu s$     |
| $t_{COLDPWR, 100\text{ nF}}$    | Latency from a cold power-up condition to release of device POR, $C_{V_{CORE}} = 100\text{ nF}$    |     | 300 | 400 | $\mu s$     |
| $t_{COLDPWR, 4.7\text{ }\mu F}$ | Latency from a cold power-up condition to release of device POR, $C_{V_{CORE}} = 4.7\text{ }\mu F$ |     | 400 | 500 | $\mu s$     |

(1) See Section 6.8.1 for details on the various classes of resets on the device

Table 5-2 lists the latencies to recover from an external reset applied on RSTn pin.

**Table 5-2. External Reset Recovery Latencies<sup>(1)</sup>**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                          | TEST CONDITIONS                                                                                                    | MIN | MAX | UNIT |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------|-----|-----|------|
| $t_{AM\_RSTn}$                     | External reset applied when device is in LDO or DC-DC based active modes, MCLK = 1 to 48 MHz                       |     | 5   | ms   |
| $t_{AMLF\_RSTn, 128\text{ kHz}}$   | External reset applied when device is in low-frequency active modes, MCLK = 128 kHz                                |     | 5.5 | ms   |
| $t_{AMLF\_RSTn, 32\text{ kHz}}$    | External reset applied when device is in low-frequency active modes, MCLK = 32.768 kHz                             |     | 6.5 | ms   |
| $t_{LPM0\_RSTn}$                   | External reset applied when device is in LDO or DC-DC based LPM0 modes, MCLK = 1 to 48 MHz                         |     | 5   | ms   |
| $t_{LPM0LF\_RSTn, 128\text{ kHz}}$ | External reset applied when device is in low-frequency LPM0 modes, MCLK = 128 kHz                                  |     | 5.5 | ms   |
| $t_{LPM0LF\_RSTn, 32\text{ kHz}}$  | External reset applied when device is in low-frequency LPM0 modes, MCLK = 32.768 kHz                               |     | 6.5 | ms   |
| $t_{LPM3\_LPM4\_RSTn}$             | External reset applied when device is in LPM3 or LPM4 modes, MCLK = 24 or 48 MHz while entering LPM3 or LPM4 modes |     | 5   | ms   |
| $t_{LPMx.5\_RSTn}$                 | External reset applied when device is in LPM3.5 or LPM4.5 modes                                                    |     | 5   | ms   |

(1) External reset is applied on RSTn pin, and the latency is measured from release of external reset to start of user application code.

### 5.25.2 Peripheral Register Access Timing

Table 5-3 lists the latency involved when CPU performs read or write access to peripheral registers.

**Table 5-3. Peripheral Register Access Latency**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER         |                                                                                      | MIN              | MAX              | UNIT        |
|-------------------|--------------------------------------------------------------------------------------|------------------|------------------|-------------|
| $t_{reg\_access}$ | Number of CPU clock cycles required for read or write access to peripheral registers | 2 <sup>(1)</sup> | 5 <sup>(2)</sup> | MCLK cycles |

(1) The bridge that connects CPU to peripherals runs at half of the speed of the CPU.

(2) The maximum value depends on the previous opcode executing in the CPU pipeline and the status of the bus (idle or busy performing data access).

### 5.25.3 Mode Transition Timing

Table 5-4 lists the latencies required to change between different active modes.

**Table 5-4. Active Mode Transition Latencies**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                    | ORIGINAL<br>OPERATING MODE | FINAL OPERATING<br>MODE | TEST CONDITIONS                                                                     | TYP | MAX | UNIT          |
|------------------------------|----------------------------|-------------------------|-------------------------------------------------------------------------------------|-----|-----|---------------|
| $t_{\text{OFF\_AMLDO0}}$     | Power Off                  | AM_LDO_VCORE0           | From $V_{\text{CC}}$ reaching 1.71 V to start of user application code              |     | 6   | ms            |
| $t_{\text{AMLDO0\_AMLDO1}}$  | AM_LDO_VCORE0              | AM_LDO_VCORE1           | Transition from AM_LDO_VCORE0 to AM_LDO_VCORE1<br>MCLK frequency = 24 MHz           | 300 | 350 | $\mu\text{s}$ |
| $t_{\text{AMLDO1\_AMLDO0}}$  | AM_LDO_VCORE1              | AM_LDO_VCORE0           | Transition from AM_LDO_VCORE1 to AM_LDO_VCORE0<br>MCLK frequency = 24 MHz           | 4   | 5   | $\mu\text{s}$ |
| $t_{\text{AMLDO0\_AMDCDC0}}$ | AM_LDO_VCORE0              | AM_DCDC_VCORE0          | Transition from AM_LDO_VCORE0 to AM_DCDC_VCORE0<br>MCLK frequency = 24 MHz          | 20  | 30  | $\mu\text{s}$ |

(1) This is the latency from WFI instruction execution by CPU to LPM3.5 mode entry.

(2) This is the latency from WFI instruction execution by CPU to LPM4.5 mode entry.

(3) This is the latency from I/O wake-up event to start of user application code.

## 5.25.4 Clock Specifications

Table 5-8 lists the input requirement for the low-frequency crystal oscillator, LFXT.

**Table 5-8. Low-Frequency Crystal Oscillator, LFXT, Recommended Operating Conditions**

over operating free-air temperature range (unless otherwise noted)

| PARAMETER          |                                                                                     | TEST CONDITIONS               | MIN | TYP | MAX | UNIT |
|--------------------|-------------------------------------------------------------------------------------|-------------------------------|-----|-----|-----|------|
| ESR                | Crystal equivalent series resistance                                                | f <sub>OSC</sub> = 32.768 kHz | 16  | 40  | 65  | kΩ   |
| C <sub>LFXT</sub>  | Capacitance from LFXT input to ground and from LFXT output to ground <sup>(1)</sup> |                               | 7.4 | 12  | 24  | pF   |
| C <sub>SHUNT</sub> | Crystal shunt capacitance                                                           |                               | 0.6 | 0.8 | 1.6 | pF   |
| C <sub>m</sub>     | Crystal motional capacitance                                                        |                               | 1   | 2   | 10  | fF   |

(1) Does not include board parasitics. Package and board add additional capacitance to  $C_{LFXT}$ .

Table 5-9 lists the characteristics of the low-frequency crystal oscillator, LFXT.

**Table 5-9. Low-Frequency Crystal Oscillator, LFXT**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

(1) Total current measured on both AVCC and DVCC supplies.

(2) Measured at ACLK pin.

(3) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. Duty cycle requirements are defined by  $DC_{LFXT, SW}$ .

(4) Maximum frequency of operation of the entire device cannot be exceeded.

(5) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:

- For LFXTDRIVE = {0},  $C_{L,eff} = 3.7 \text{ pF}$ .
- For LFXTDRIVE = {1},  $6 \text{ pF} \leq C_{L,eff} \leq 9 \text{ pF}$ .
- For LFXTDRIVE = {2},  $6 \text{ pF} \leq C_{L,eff} \leq 10 \text{ pF}$ .
- For LFXTDRIVE = {3},  $6 \text{ pF} \leq C_{L,eff} \leq 12 \text{ pF}$ .

| f <sub>Fault,LFXT</sub>                              | Oscillator fault frequency <sup>(9) (10)</sup>                                                                                                                             |                 | 1   |     | 3   | kHz  |

(6) This represents all the parasitic capacitance present at the LFXIN and LFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, C<sub>L,eff</sub> can be computed as C<sub>IN</sub> x C<sub>OUT</sub> / (C<sub>IN</sub> + C<sub>OUT</sub>), where C<sub>IN</sub> and C<sub>OUT</sub> are the total capacitance at the LFXIN and LFXOUT terminals, respectively.

(7) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 3.7 pF, 6 pF, 9 pF, and 12 pF. Maximum shunt capacitance of 1.6 pF. Because the PCB adds additional capacitance, it must also be considered in the overall capacitance. TI recommends verifying that the recommended effective load capacitance of the selected crystal is met.

(8) Does not include programmable start-up counter.

(9) Frequencies above the MAX specification do not set the fault flag. Frequencies in between the MIN and MAX specification may set the flag. A static condition or stuck at fault condition will set the fault flag.

(10) Measured with logic-level input frequency but also applies to operation with crystals.

Table 5-10 lists the input requirements for the high-frequency crystal oscillator, HFXT.

(1) Maximum frequency of operation of the entire device cannot be exceeded.

(2) When HFXTBYPASS is set, HFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. Duty cycle requirements are defined by DC<sub>HFXT, SW</sub>.

| f <sub>Fault,HFXT</sub> | Oscillator fault frequency <sup>(7)</sup> <sup>(8)</sup>                     |                                                                                                                                                                  |                 | 400 |     | 700 | kHz  |

(4) Does not include programmable start-up counter.

(5) This represents all the parasitic capacitance present at the HFXIN and HFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, C<sub>L,eff</sub> can be computed as C<sub>IN</sub> x C<sub>OUT</sub> / (C<sub>IN</sub> + C<sub>OUT</sub>), where C<sub>IN</sub> and C<sub>OUT</sub> is the total capacitance at the HFXIN and HFXOUT terminals, respectively.

(6) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 14 pF, 16 pF, and 18 pF. Maximum shunt capacitance of 7 pF. Because the PCB adds additional capacitance, it must also be considered in the overall capacitance. TI recommends verifying that the recommended effective load capacitance of the selected crystal is met.

(7) Frequencies above the MAX specification do not set the fault flag. Frequencies in between the MIN and MAX might set the flag. A static condition or stuck at fault condition will set the flag.

(8) Measured with logic-level input frequency but also applies to operation with crystals.

Table 5-12 lists the characteristics of the DCO.

### 5.25.5 Power Supply System

Table 5-19 lists the LDO  $V_{\text{CORE}}$  regulator characteristics.

**Table 5-19.  $V_{\text{CORE}}$  Regulator (LDO) Characteristics**

| PARAMETER                |                                                                                               | TEST CONDITIONS                                   | MIN  | TYP | MAX  | UNIT |
|--------------------------|-----------------------------------------------------------------------------------------------|---------------------------------------------------|------|-----|------|------|
| V <sub>CORE0-HP</sub>    | Static V <sub>CORE</sub> voltage Level 0 in active and LPM0 modes                             | Device power modes AM_LDO_VCORE0, LPM0_LDO_VCORE0 | 1.12 | 1.2 | 1.28 | V    |
| V <sub>CORE1-HP</sub>    | Static V <sub>CORE</sub> voltage Level 1 in active and LPM0 modes                             | Device power modes AM_LDO_VCORE1, LPM0_LDO_VCORE1 | 1.31 | 1.4 | 1.49 | V    |
| V <sub>CORE0-LF</sub>    | Static V <sub>CORE</sub> voltage Level 0 in low-frequency active and low frequency LPM0 modes | Device power modes AM_LF_VCORE0                   | 1.12 | 1.2 | 1.28 | V    |
| V <sub>CORE1-LF</sub>    | Static V <sub>CORE</sub> voltage Level 1 in low-frequency active and low frequency LPM0 modes | Device power modes AM_LF_VCORE1                   | 1.31 | 1.4 | 1.49 | V    |
| V <sub>CORE0-LPM34</sub> | Static V <sub>CORE</sub> voltage Level 0 in LPM3 and LPM4 modes                               | Device power modes LPM3, LPM4                     | 1.08 | 1.2 | 1.32 | V    |
| V <sub>CORE1-LPM34</sub> | Static V <sub>CORE</sub> voltage Level 1 in LPM3 and LPM4 modes                               | Device power modes LPM3, LPM4                     | 1.27 | 1.4 | 1.53 | V    |
| V <sub>CORE0-LPM35</sub> | Static V <sub>CORE</sub> voltage Level 0 in LPM3.5 mode                                       | Device power mode LPM3.5                          | 1.08 | 1.2 | 1.32 | V    |
| I <sub>INRUSH-ST</sub>   | Inrush current at start-up                                                                    | Device power-up                                   |      |     | 200  | mA   |
| I <sub>PEAK-LDO</sub>    | Peak current drawn by LDO from DV <sub>CC</sub>                                               |                                                   |      |     | 350  | mA   |
| I <sub>SC-coreLDO</sub>  | Short circuit current limit for core LDO                                                      | Measured when output is shorted to ground         |      |     | 300  | mA   |

Table 5-20 lists the DC-DC  $V_{\text{CORE}}$  regulator characteristics.

**Table 5-20.  $V_{\text{CORE}}$  Regulator (DC-DC) Characteristics**

| PARAMETER                           | TEST CONDITIONS                                                          | MIN                                                       | TYP | MAX  | UNIT |      |   |
|-------------------------------------|--------------------------------------------------------------------------|-----------------------------------------------------------|-----|------|------|------|---|
| DV <sub>CC-DCDC</sub>               | Allowed DV <sub>CC</sub> range for DC-DC operation                       | DCDC_FORCE = 1                                            |     | 1.8  | 3.7  | V    |   |
| V <sub>DCDC_SO</sub> <sup>(1)</sup> | DC-DC to LDO switch over voltage                                         | dDV <sub>CC</sub> /dt = 1 V/ms, DCDC_FORCE = 0            |     | 1.8  | 2.0  | V    |   |
| V <sub>CORE0-DCDC</sub>             | Static V <sub>CORE</sub> voltage Level 0 in DC-DC high-performance modes | Device power modes<br>AM_DCDC_VCORE0,<br>LPM0_DCDC_VCORE0 |     | 1.12 | 1.2  | 1.28 | V |
| V <sub>CORE1-DCDC</sub>             | Static V <sub>CORE</sub> voltage Level 1 in DC-DC high-performance modes | Device power modes<br>AM_DCDC_VCORE1,<br>LPM0_DCDC_VCORE1 |     | 1.31 | 1.4  | 1.49 | V |
| I <sub>PEAK-DCDC</sub>              | Peak current drawn by DC-DC from DV <sub>CC</sub>                        |                                                           |     |      | 300  | mA   |   |
| I <sub>SC-DCDC</sub>                | Short circuit current limit for DC-DC                                    | Measured when output is shorted to ground                 |     |      | 500  | mA   |   |

(1) When DV<sub>CC</sub> falls below this voltage, internally the regulator switches over to LDO from DC-DC.

Table 5-21 lists the VCCDET characteristics.

**Table 5-21. PSS, VCCDET**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER           |                                                             | TEST CONDITIONS                    | MIN  | TYP  | MAX  | UNIT |
|---------------------|-------------------------------------------------------------|------------------------------------|------|------|------|------|
| $V_{VCC\_VCCDET-}$  | VCCDET power-down level (trip point with falling $V_{CC}$ ) | $dV_{CC}/dt < 3 \text{ V/s}^{(1)}$ | 0.64 | 1.12 | 1.55 | V    |
| $V_{VCC\_VCCDET+}$  | VCCDET power-up level (trip point with rising $V_{CC}$ )    | $dV_{CC}/dt < 3 \text{ V/s}^{(1)}$ | 0.70 | 1.18 | 1.59 | V    |
| $V_{VCC\_VCC\_hys}$ | VCCDET hysteresis                                           |                                    | 30   | 65   | 100  | mV   |

(1) The VCCDET levels are measured with a slow-changing supply. Faster slopes can result in different levels.

Table 5-22 lists the SVSMH characteristics.

**Table 5-22. PSS, SVSMH**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER       |                                                                         | TEST CONDITIONS                                                             | MIN  | TYP  | MAX  | UNIT          |

- (1) If the SVSMH is kept disabled in active mode and is enabled before entering a low-power mode of the device (LPM3, LPM4, LPM3.5, or LPM4.5) care should be taken that sufficient time has elapsed since enabling of the module before entry into the device low-power mode to allow for successful wake up of the SVSMH module per the SVSMH on or off delay time specification. Otherwise, SVSMH may trip, causing the device to reset and wake up from the low-power mode.

## 5.25.6 Digital I/Os

Table 5-23 lists the characteristics of the digital inputs.

**Table 5-23. Digital Inputs (Applies to Both Normal and High-Drive I/Os)**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| I <sub>lkg,hdio</sub> High-drive I/O high-impedance input leakage current                          | See <sup>(1)(2)</sup>                                                                                            | 2.2 V, 3 V      |      |     | ±20  | nA   |
| t <sub>int</sub> External interrupt timing (external trigger pulse duration to set interrupt flag) | Ports with interrupt capability and without glitch filter <sup>(3)</sup>                                         | 2.2 V, 3 V      | 20   |     |      | ns   |
|                                                                                                    | Ports with interrupt capability and with glitch filter but glitch filter disabled (GLTFLT_EN = 0) <sup>(3)</sup> | 2.2 V, 3 V      | 20   |     |      |      |
|                                                                                                    | Ports with interrupt capability and with glitch filter, glitch filter enabled (GLTFLT_EN = 1) <sup>(4)</sup>     | 2.2 V, 3 V      | 0.25 |     | 1    | μs   |
| t <sub>RST</sub> External reset pulse duration on RSTn pin <sup>(5)</sup>                          |                                                                                                                  | 2.2 V, 3 V      | 1    |     |      | μs   |

(1) The input leakage current is measured with V<sub>SS</sub> or V<sub>CC</sub> applied to the corresponding pins, unless otherwise noted.

(2) The input leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup/pulldown resistor is disabled.

(3) An external signal sets the interrupt flag every time the minimum interrupt pulse duration t<sub>int</sub> is met. It may be set by trigger signals shorter than t<sub>int</sub>.

(4) A trigger pulse duration less than the MIN value is always filtered, and a trigger pulse duration more than the MAX value is always passed. The trigger pulse may or may not be filtered if the duration is between the MIN and MAX values.

(5) Not applicable if RSTn/NMI pin configured as NMI.

Table 5-24 lists the characteristics of the normal-drive digital outputs.

- (1) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.
- (2) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±100 mA to hold the maximum voltage drop specified.
- (3) The port can output frequencies at least up to the specified limit - it might support higher frequencies.
- (4) A resistive divider with 2 × R1 and R1 = 3.2kΩ between V<sub>CC</sub> and V<sub>SS</sub> is used as load. The output is connected to the center tap of the divider. C<sub>L</sub> = 20 pF is connected to the output to V<sub>SS</sub>.
- (5) The output voltage reaches at least 20% and 80% V<sub>CC</sub> at the specified toggle frequency.
- (6) Measured between 20% of V<sub>CC</sub> to 80% of V<sub>CC</sub>.
- (7) Measured between 80% of V<sub>CC</sub> to 20% of V<sub>CC</sub>.

Table 5-25 lists the characteristics of the high-drive digital outputs.

**Table 5-25. Digital Outputs, High-Drive I/Os**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

- (1) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.
- (2) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±100 mA to hold the maximum voltage drop specified.
- (3) The port can output frequencies at least up to the specified limit, and it might support higher frequencies.
- (4) A resistive divider with 2 × R1 and R1 = 3.2 kΩ between V<sub>CC</sub> and V<sub>SS</sub> is used as load. The output is connected to the center tap of the divider. C<sub>L</sub> = 80 pF is connected to the output to V<sub>SS</sub>.
- (5) The output voltage reaches at least 20% and 80% V<sub>CC</sub> at the specified toggle frequency.
- (6) Measured between 20% of V<sub>CC</sub> to 80% of V<sub>CC</sub>.
- (7) Measured between 80% of V<sub>CC</sub> to 20% of V<sub>CC</sub>.

Table 5-26 lists the frequencies of the pin-oscillator ports. See Figure 5-27 and Figure 5-28 for the typical characteristics graphs.

**Table 5-26. Pin-Oscillator Frequency, Ports Px**

- (1) The temperature sensor offset can be as much as  $\pm 35^\circ\text{C}$ . TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
- (2) The TLV structure contains calibration values for  $30^\circ\text{C} \pm 3^\circ\text{C}$  and  $85^\circ\text{C} \pm 3^\circ\text{C}$  for each of the available reference voltage levels. The sensor voltage can be computed as  $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$ , where  $TC_{SENSOR}$  and  $V_{SENSOR}$  can be computed from the calibration values for higher accuracy.
- (3) The typical equivalent impedance of the sensor is 250 k $\Omega$ . The sample time required includes the sensor-on time  $t_{SENSOR(on)}$ .
- (4) The on-time  $t_{V1/2(on)}$  is included in the sampling time  $t_{V\ 1/2 (sample)}$ . No additional on time is needed.

**Figure 5-29. Typical Temperature Sensor Voltage**

Table 5-32 lists the characteristics of the internal reference buffers of the ADC.

**Table 5-32. Precision ADC, Internal Reference Buffers**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

|                                                                                                         | 1.45 V ≤ V <sub>eREF+</sub> ≤ V <sub>AVCC</sub> , V <sub>eREF-</sub> = 0 V, f <sub>ADC14CLK</sub> = 5 MHz, ADC14SHT0x = 0x1, ADC14SHT1x = 0x1, ADC14DIF = 1  |      |     | ±30              |      |
| C <sub>VeREF+</sub> Capacitance at VeREF+ terminal                                                      | See <sup>(2)</sup>                                                                                                                                           | 5    |     |                  | μF   |

(1) Lower reference voltage down to 1.2 V can be applied for 1 Msps sampling rate with reduced accuracy requirements of linearity parameters.

(2) Two decoupling capacitors, 5 μF and 50 nF, should be connected to VeREF+ terminal to decouple the dynamic current required for an external reference source if it is used for the Precision ADC. Also see the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#).

| f <sub>BITCLK</sub> BITCLK clock frequency<br>(equals baud rate in MBaud) |                                                              | 1.2 V |     |     | 5   | MHz  |
|                                                                           |                                                              | 1.4 V |     |     | 7   |      |

Table 5-37 lists the characteristics of the eUSCI in UART mode.

**Table 5-37. eUSCI Switching Characteristics (UART Mode)**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                                                | TEST CONDITIONS | V <sub>CC</sub> | MIN | TYP | MAX | UNIT |
|----------------------------------------------------------|-----------------|-----------------|-----|-----|-----|------|
| t <sub>t</sub> UART receive deglitch time <sup>(1)</sup> | UCGLITx = 0     |                 | 5   |     | 20  | ns   |
|                                                          | UCGLITx = 1     |                 | 20  |     | 60  |      |
|                                                          | UCGLITx = 2     |                 | 30  |     | 100 |      |
|                                                          | UCGLITx = 3     |                 | 50  |     | 150 |      |

- (1) Pulses on the UART receive input (UCxRX) that are shorter than the UART receive deglitch time are suppressed. Thus the selected deglitch time can limit the maximum useable baud rate. To ensure that pulses are correctly recognized, their duration should exceed the maximum specification of the deglitch time.

Table 5-38 lists the supported clock frequencies of the eUSCI in SPI master mode.

**Table 5-38. eUSCI Clock Frequency (SPI Master Mode)**

| PARAMETER                                      | CONDITIONS                      |               | V <sub>CC</sub> | MIN | TYP | MAX | UNIT |

### 5.25.11 Timers

Table 5-43 lists the characteristics of Timer\_A.

**Table 5-43. Timer\_A**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER           |                               | TEST CONDITIONS                                                       | V <sub>CORE</sub> | V <sub>CC</sub> | MIN | MAX | UNIT |
|---------------------|-------------------------------|-----------------------------------------------------------------------|-------------------|-----------------|-----|-----|------|
| f <sub>TA</sub>     | Timer_A input clock frequency | Internal: SMCLK<br>External: TACLK<br>Duty cycle = 50% ±10%           | 1.2 V             |                 |     | 12  | MHz  |
|                     |                               |                                                                       | 1.4 V             |                 |     | 24  |      |
| t <sub>TA,cap</sub> | Timer_A capture timing        | All capture inputs,<br>Minimum pulse duration required<br>for capture |                   |                 | 20  |     | ns   |

Table 5-44 lists the characteristics of Timer32.

**Table 5-44. Timer32**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER        |                                                  | TEST CONDITIONS | V <sub>CORE</sub> | V <sub>CC</sub> | MIN | MAX | UNIT |
|------------------|--------------------------------------------------|-----------------|-------------------|-----------------|-----|-----|------|
| f <sub>T32</sub> | Timer32 operating clock frequency <sup>(1)</sup> |                 | 1.2 V             |                 |     | 24  | MHz  |
|                  |                                                  |                 | 1.4 V             |                 |     | 48  |      |

(1) Timer32 operates on the same clock as the Cortex-M4 CPU.

## 5.25.12 Memories

Table 5-45 lists the general characteristics of the flash memory.

**Table 5-45. Flash Memory**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                  |                                                       | MIN   | MAX | UNIT   |
|----------------------------|-------------------------------------------------------|-------|-----|--------|
| DVCC <sub>PGM/ERS</sub>    | Supply voltage for program or erase                   | 1.62  | 3.7 | V      |
| I <sub>PGM/ERS, PEAK</sub> | Peak supply current from DVCC during program or erase |       | 10  | mA     |
| N <sub>Endurance</sub>     | Program or erase endurance <sup>(1)</sup>             | 20000 |     | cycles |
| t <sub>Retention</sub>     | Data retention duration                               | 20    |     | years  |

(1) Program or erase cycle for a bit is defined as the value of bit changing from 1 to 0 to 1.

Table 5-46 lists the characteristics of the flash operations using MSP432 peripheral driver libraries.

**Table 5-46. Flash Operations Using MSP432 Peripheral Driver Libraries<sup>(1)</sup>**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER                        |                                                                                        | TEST CONDITIONS                                                                                                     |  | MIN | TYP | MAX                  | UNIT |
|----------------------------------|----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--|-----|-----|----------------------|------|
| t <sub>PGM_API, Word</sub>       | Program time for 32-bit data using ROM_FlashCtl_programMemory() API                    | VCORE = 1.4 V, MCLK = 48 MHz                                                                                        |  |     | 40  | 275                  | μs   |
| t <sub>PGM_API, Sector</sub>     | Program time for 4KB of data (one sector) using ROM_FlashCtl_programMemory() API       | VCORE = 1.4 V, MCLK = 48 MHz                                                                                        |  |     | 4.5 | 71                   | ms   |
| t <sub>ERS_API, Sector</sub>     | Sector erase time using ROM_FlashCtl_eraseSector() API                                 | VCORE = 1.4 V, MCLK = 48 MHz, Number of erase or program cycles <1k                                                 |  |     | 9   | 309 <sup>(2)</sup>   | ms   |
|                                  |                                                                                        | VCORE = 1.4 V, MCLK = 48 MHz, Number of erase or program cycles >1k and <20k                                        |  |     | 9   | 3035 <sup>(2)</sup>  |      |
| t <sub>ERS_API, Mass-Erase</sub> | Mass erase time using ROM_FlashCtl_performMassErase() API                              | VCORE = 1.4 V, MCLK = 48 MHz, Number of erase or program cycles <1k, MSP432P401R devices with 256KB of flash memory |  |     | 12  | 19800 <sup>(3)</sup> | ms   |
|                                  |                                                                                        | VCORE = 1.4 V, MCLK = 48 MHz, Number of erase or program cycles <1k, MSP432P401M devices with 128KB of flash memory |  |     | 12  | 9900 <sup>(3)</sup>  |      |
| I <sub>AVGPGM_API</sub>          | Average supply current from DVCC during program using ROM_FlashCtl_programMemory() API | VCORE = 1.2 V, MCLK = 3 MHz                                                                                         |  |     | 5   | 7                    | mA   |
| I <sub>AVGERS_API</sub>          | Average supply current from DVCC during erase using ROM_FlashCtl_eraseSector() API     | VCORE = 1.2 V, MCLK = 3 MHz                                                                                         |  |     | 2   | 3                    | mA   |

(1) MSP432 peripheral driver libraries executed from ROM.

(2) The maximum value is theoretically calculated by multiplying the typical value by N<sub>MAX\_ERS</sub> for the specific erase or program endurance.

(3) The maximum value is theoretically calculated by multiplying the typical value by N<sub>MAX\_ERS</sub> for the specific erase or program endurance and the total number of sectors in the flash main memory.

Table 5-47 lists the characteristics of the flash stand-alone operations.

**Table 5-47. Flash Stand-Alone Operations**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER             |                                                              | TEST CONDITIONS                                | MIN | TYP | MAX | UNIT    |
|-----------------------|--------------------------------------------------------------|------------------------------------------------|-----|-----|-----|---------|
| $t_{PGM}$ , Immediate | Program time for one 32-bit data using immediate write mode  | VER_PRE = 0, VER_PST = 1                       |     | 40  |     | $\mu s$ |
|                       |                                                              | VER_PRE = 1, VER_PST = 1                       |     | 60  |     |         |
| $t_{PGM}$ , Full-word | Program time for one 128-bit word using full word write mode | VER_PRE = 0, VER_PST = 1                       |     | 40  |     | $\mu s$ |
|                       |                                                              | VER_PRE = 1, VER_PST = 1                       |     | 60  |     |         |
| $t_{PGM}$ , Burst     | Program time for 4×128-bit burst using burst write mode      | AUTO_PRE = 0, AUTO_PST = 1                     |     | 65  |     | $\mu s$ |
|                       |                                                              | AUTO_PRE = 1, AUTO_PST = 1                     |     | 85  |     |         |
| $t_{ERS}$             | Time for sector erase or mass erase                          |                                                |     | 9   |     | ms      |
| $N_{MAX\_PGM}$        | Maximum number of pulses to complete program operation       |                                                |     |     | 5   |         |
| $N_{MAX\_ERS}$        | Maximum number of pulses to complete erase operation         | Number of erase or program cycles <1k          |     |     | 34  |         |
|                       |                                                              | Number of erase or program cycles >1k and <20k |     |     | 334 |         |

Table 5-48 lists the characteristics of the SRAM.

**Table 5-48. SRAM**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER            |                                                      | TEST CONDITIONS | MIN | TYP | MAX  | UNIT    |
|----------------------|------------------------------------------------------|-----------------|-----|-----|------|---------|
| $I_{SRAM\_EN}$       | Current consumption of one SRAM bank when enabled    | VCORE = 1.2 V   |     | 100 | 3500 | nA      |
|                      |                                                      | VCORE = 1.4 V   |     | 300 | 5500 |         |
| $I_{SRAM\_RET}$      | Current consumption of one SRAM bank under retention | VCORE = 1.2 V   |     | 30  | 1250 | nA      |
|                      |                                                      | VCORE = 1.4 V   |     | 35  | 1200 |         |
| $t_{SRAM\_EN, one}$  | Time taken to enable one SRAM bank                   |                 |     | 4   | 5    | $\mu s$ |
| $t_{SRAM\_DIS, one}$ | Time taken to disable one SRAM bank                  |                 |     | 4   | 5    | $\mu s$ |
| $t_{SRAM\_EN, all}$  | Time taken to enable all SRAM banks except Bank 0    |                 |     | 7   | 8    | $\mu s$ |
| $t_{SRAM\_DIS, all}$ | Time taken to disable all SRAM banks except Bank 0   |                 |     | 4   | 5    | $\mu s$ |

### 5.25.13 Emulation and Debug

Table 5-49 lists the characteristics of the JTAG interface.

**Table 5-49. JTAG**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (see Figure 5-74 and Figure 5-75)

| PARAMETER       |                                            | MIN | TYP         | MAX | UNIT |
|-----------------|--------------------------------------------|-----|-------------|-----|------|
| $f_{TCK}$       | TCK clock frequency                        | 0   |             | 10  | MHz  |
| $t_{TCK}$       | TCK clock period                           | 100 |             |     | ns   |
| $t_{TCK\_LOW}$  | TCK clock low time                         |     | $t_{TCK}/2$ |     | ns   |
| $t_{TCK\_HIGH}$ | TCK clock high time                        |     | $t_{TCK}/2$ |     | ns   |
| $t_{TCK\_RISE}$ | TCK rise time                              | 0   |             | 10  | ns   |
| $t_{TCK\_FALL}$ | TCK fall time                              | 0   |             | 10  | ns   |
| $t_{TMS\_SU}$   | TMS setup time to TCK rise                 | 30  |             |     | ns   |
| $t_{TMS\_HLD}$  | TMS hold time from TCK rise                | 9   |             |     | ns   |
| $t_{TDI\_SU}$   | TDI setup time to TCK rise                 | 20  |             |     | ns   |
| $t_{TDI\_HLD}$  | TDI hold time from TCK rise                | 7   |             |     | ns   |
| $t_{TDO\_ZDV}$  | TCK fall to data valid from high impedance |     | 9           | 44  | ns   |
| $t_{TDO\_DV}$   | TCK fall to data valid from data valid     |     | 9           | 44  | ns   |
| $t_{TDO\_DVZ}$  | TCK fall to high impedance from data valid |     | 8           | 38  | ns   |

**Figure 5-75. JTAG Test Access Port (TAP) Timing**

## 6 Detailed Description

### 6.1 Overview

The MSP432P401x microcontroller is an ideal combination of the TI MSP430 low-power DNA, advanced mixed-signal features, and the processing capabilities of the Arm 32-bit Cortex-M4 RISC engine. The microcontrollers ship with bundled driver libraries and are compatible with standard components of the Arm ecosystem.

### 6.2 Processor and Execution Features

The Cortex-M4 processor provides a high-performance low-cost platform that meets system requirements of minimal memory implementation, reduced pin count, and low power consumption, while delivering outstanding computational performance and exceptional system response to interrupts. The Thumb®-2 mixed 16- and 32-bit instruction set of the processor delivers the high performance that is expected of a 32-bit Arm core in a compact memory size usually associated with 8- and 16-bit devices (typically in the range of a few kilobytes of memory needed for microcontroller-class applications).

In the MSP432P401x MCUs, the Cortex-M4 processor can run up to 48 MHz, delivering high performance for the targeted class of applications, while at the same time maintaining ultra-low active power consumption.

#### 6.2.1 Floating-Point Unit

The Cortex-M4 processor on the MSP432P401x MCUs includes a tightly coupled floating-point unit (FPU). The FPU is an IEEE 754 compliant single precision floating point module supporting add, subtract, multiply, divide, accumulate, and square-root operations. It also provides conversion between fixed-point and floating-point data formats and floating point constant instructions.

#### 6.2.2 Memory Protection Unit

The Cortex-M4 processor on the MSP432P401x MCUs includes a tightly coupled memory protection unit (MPU) that supports up to eight protection regions. Applications can use the MPU to enforce memory privilege rules that isolate processes from each other or enforce memory access rules. These features are typically required for operating system handling purposes.

#### 6.2.3 Nested Vectored Interrupt Controller (NVIC)

The NVIC supports up to 64 interrupts with eight levels of interrupt priority. The Cortex-M4 NVIC architecture allows for low latency, efficient interrupt and event handling, and seamless integration to device-level power-control strategies.

#### 6.2.4 SysTick

The Cortex-M4 includes an integrated system timer, SysTick, which provides a simple, 24-bit, clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used in several different ways, and it is typically deployed either for operating system related purposes or as a general-purpose alarm mechanism.

#### 6.2.5 Debug and Trace Features

The Cortex-M4 processor implements a complete hardware debug solution and provides high system visibility of the processor and memory through either a traditional 4-pin JTAG port or a 2-pin Serial Wire Debug (SWD) port, which is ideal for microcontrollers and other small-package devices. The SWJ-DP interface combines the SWD and JTAG debug ports into one module, which allows a seamless switch between the 2-pin and 4-pin modes of operation, depending on application needs.

For system trace, the processor integrates an Instrumentation Trace Macrocell (ITM) alongside data watch points and a profiling unit. To enable simple and cost-effective profiling of the system trace events, a Serial Wire Viewer (SWV) can export a stream of software-generated messages, data trace, and profiling information through a single pin.

#### NOTE

For detailed specifications and information on the programmer's model for the Cortex-M4 CPU and the associated peripherals mentioned throughout [Section 6.2](#), see the appropriate reference manual at [www.arm.com](http://www.arm.com).

## 6.3 Memory Map

The device supports a 4GB address space that is divided into eight 512MB zones (see [Figure 6-1](#)).

|             |                            |
|-------------|----------------------------|
| 0xFFFF_FFFF | Debug/Trace<br>Peripherals |
| 0xE000_0000 |                            |
| 0xDFFF_FFFF | Unused                     |
| 0xC000_0000 |                            |
| 0xBFFF_FFFF | Unused                     |
| 0xA000_0000 |                            |
| 0x9FFF_FFFF | Unused                     |
| 0x8000_0000 |                            |
| 0x7FFF_FFFF | Unused                     |
| 0x6000_0000 |                            |
| 0x5FFF_FFFF | Peripherals                |
| 0x4000_0000 |                            |
| 0x3FFF_FFFF | SRAM                       |
| 0x2000_0000 |                            |
| 0x1FFF_FFFF | Code                       |
| 0x0000_0000 |                            |

**Figure 6-1. Device Memory Zones**

### 6.3.1 Code Zone Memory Map

The region from 0x0000\_0000 to 0x1FFF\_FFFF is defined as the Code zone, and is accessible through the ICODE and DCODE buses of the Cortex-M4 processor and through the system DMA. This region maps the flash, the ROM, and the internal SRAM (permitting optimal single-cycle execution from the SRAM).

[Figure 6-2](#) shows the MSP432P401x-specific memory map of the Code zone, as visible to the user code.

**Figure 6-2. Code Zone Memory Map**

#### 6.3.1.1 Flash Memory Region

The 4MB region from 0x0000\_0000 to 0x003F\_FFFF is defined as the flash memory region. This region is further divided into different types of flash memory regions, which are explained in [Section 6.4.1](#).

#### 6.3.1.2 SRAM Region

The 1MB region from 0x0100\_0000 to 0x010F\_FFFF is defined as the SRAM region. This region is also aliased in the SRAM *zone* of the device, thereby allowing efficient access to the SRAM, both for instruction fetches and data reads. See [Section 6.4.2](#) for more details.

#### 6.3.1.3 ROM Region

The 1MB region from 0x0200\_0000 to 0x020F\_FFFF is defined as the ROM region. See [Section 6.4.3](#) for details about the ROM.

### 6.3.2 SRAM Zone Memory Map

The SRAM zone of the device lies in the address range of 0x2000\_0000 to 0x3FFF\_FFFF. [Figure 6-3](#) shows how this zone is divided.

**Figure 6-3. SRAM Zone Memory Map**

#### 6.3.2.1 SRAM Region

The 1MB region from 0x2000\_0000 to 0x200F\_FFFF is defined as the SRAM region. The SRAM accessible in this region is also aliased in the Code zone of the device, thereby allowing efficient access to the SRAM, both for instruction fetches and data reads. See [Section 6.4.2](#) for details about the SRAM.

#### 6.3.2.2 SRAM Bit-Band Alias Region

The 32MB region from 0x2200\_0000 to 0x23FF\_FFFF forms the bit-band alias region for the 1-MB SRAM region. Bit-banding is a feature of the Cortex-M4 processor and allows the application to set or clear individual bits throughout the SRAM space without using the pipeline bandwidth of the processor to carry out an exclusive read-modify-write sequence.

### 6.3.3 Peripheral Zone Memory Map

The Peripheral zone of the device lies in the address range of 0x4000\_0000 to 0x5FFF\_FFFF. [Figure 6-4](#) shows how this range is further divided.

**Figure 6-4. Peripheral Zone Memory Map**

### 6.3.3.1 Peripheral Region

The 1MB region from 0x4000\_0000 to 0x400F\_FFFF is dedicated to the system and application control peripherals of the device. On the MSP432P401x MCUs, a total of 128KB of this region is dedicated for peripherals, while the rest is reserved. [Table 6-1](#) lists the peripheral allocation within this 128-KB space. Note that all peripherals may not be available in all devices of the family (details in the REMARKS column). If a peripheral is listed as N/A for a particular device, treat the corresponding address space as reserved.

#### NOTE

Peripherals that are marked as 16-bit should be accessed through byte or half-word size read or write only. Any 32-bit access to these peripherals results in a bus error response.

**Table 6-1. Peripheral Address Offsets**

| ADDRESS RANGE              | PERIPHERAL | TABLE                      | REMARKS           |

### 6.3.3.2 Peripheral Bit Band Alias Region

The 32MB region from 0x4200\_0000 to 0x43FF\_FFFF forms the bit-band alias region for the 1MB peripheral region. Bit-banding is a feature of the Cortex-M4 processor and allows the application to set or clear individual bits throughout the peripheral memory space without using the pipeline bandwidth of the processor to carry out an exclusive read-modify-write sequence.

#### NOTE

The restriction of accessing 16-bit peripherals only through byte or half-word accesses also applies to the corresponding bit-band region of these peripherals. In other words, writes to the bit-band alias region for these peripherals must be in the form of byte or half-word accesses only.

### 6.3.4 Debug and Trace Peripheral Zone

This zone maps the internal and external PPB regions of the Cortex-M4 (see [Table 6-32](#)). The following peripherals are mapped to this zone:

- Core and System debug control registers (internal PPB)
- NVIC and other registers in the System Control space of the Cortex-M4 (internal PPB)
- FPB, DWT, ITM (internal PPB)
- TPIU, Debug ROM table (external PPB)
- Reset Controller (external PPB)
- System Controller (external PPB)

**Table 6-32. Debug Zone Memory Map**

| ADDRESS RANGE              | MODULE OR PERIPHERAL                                | REMARKS      |
|----------------------------|-----------------------------------------------------|--------------|
| 0xE000_0000 to 0xE000_0FFF | ITM                                                 | Internal PPB |

## 6.4 Memories on the MSP432P401x

The MSP432P401x MCUs include flash memory and SRAM for general application purposes. In addition, the devices include a backup memory (a portion of total available SRAM) that is retained in low-power modes.

### 6.4.1 Flash Memory

The MSP432P401x MCUs include a high-endurance low-power flash memory that supports up to a minimum of 20000 write or erase cycles. The flash memory is 128 bits wide, thereby enabling high code execution performance by virtue of each fetch returning up to four 32-bit instructions (or up to eight 16-bit instructions). The flash is further divided into two types of subregions: main memory and information memory.

From a physical perspective, the flash memory comprises two banks, with the main and information memory regions divided equally between the two banks. This permits an application to carry out a simultaneous read or execute operation from one bank while the other bank may be undergoing a program or erase operation.

Figure 6-5 shows the memory map of the flash on MSP432P401x MCUs.

**Figure 6-5. Flash Memory Map**

#### 6.4.1.1 Flash Main Memory (0x0000\_0000 to 0x0003\_FFFF)

The flash main memory on MSP432P401x MCUs can be up to 256KB. Flash main memory consists of up to 64 sectors of 4KB each, with a minimum erase granularity of 4KB (1 sector). The main memory can be viewed as two independent identical banks of up to 128KB each, allowing simultaneous read or execute from one bank while the other bank is undergoing a program or erase operation.

#### 6.4.1.2 Flash Information Memory (0x0020\_0000 to 0x0020\_3FFF)

The flash information memory region is 16KB. Flash information memory consists of four sectors of 4KB each, with a minimum erase granularity of 4KB (1 sector). [Table 6-35](#) describes different regions of flash information memory and the contents of each of the regions. The flash information memory region that contains the device descriptor (TLV) is factory configured for protection against write and erase operations.

**Table 6-35. Flash Information Memory Regions**

| REGION           | ADDRESS RANGE              | CONTENTS                    | WRITE AND ERASE PROTECTED? |
|------------------|----------------------------|-----------------------------|----------------------------|
| Bank 0, Sector 0 | 0x0020_0000 to 0x0020_0FFF | Flash boot-override mailbox | No                         |
| Bank 0, Sector 1 | 0x0020_1000 to 0x0020_1FFF | Device descriptor (TLV)     | Yes                        |
| Bank 1, Sector 0 | 0x0020_2000 to 0x0020_2FFF | TI BSL                      | No                         |
| Bank 1, Sector 1 | 0x0020_3000 to 0x0020_3FFF | TI BSL                      | No                         |

#### 6.4.1.3 Flash Operation

The flash memory provides multiple read and program modes of operation that the application can deploy. Up to 128 bits (memory word width) can be programmed (set from 1 to 0) in a single program operation. Although the CPU data buses are 32 bits wide, the flash can buffer 128-bit write data before initiating flash programming, thereby making it more seamless and power efficient for software to program large blocks of data at a time. In addition, the flash memory also supports a burst write mode that takes less time when compared to programming words individually. See for information on timing parameters.

The flash main and information memory regions offer write/erase protection control at a sector granularity to enable software to optimize operations like mass erase while protecting certain regions of the flash. In low-power modes of operation, the flash memory is disabled and put in a power-down state to minimize leakage.

For details on the flash memory and its various modes of operation and configuration, see the *Flash Controller (FLCTL)* chapter in the *MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual*.

#### NOTE

Depending on the CPU (MCLK) frequency and the active mode in use, the flash may need to be accessed with single/multiple wait states. Whenever there is a change required in the operating frequency, it is the responsibility of the application to ensure that the flash access wait states are configured correctly before the frequency change is effected. See the electrical specification for details on flash wait state requirements.

## 6.4.2 SRAM

The MSP432P401x MCUs support up to 64KB of SRAM, with the rest of the 1MB SRAM region reserved. The SRAM is aliased in both Code and SRAM zones. This enables fast single-cycle execution of code from the SRAM, as the Cortex-M4 processor pipelines instruction fetches to memory zones other than the Code space. As with the flash memory, the SRAM can be powered down or placed in a low-leakage retention state in low-power modes of operation.

Figure 6-6 shows the memory map of SRAM on MSP432P401x MCUs.

**Figure 6-6. SRAM Map**

### 6.4.2.1 SRAM Bank Enable Configuration

The application can optimize the power consumption of the SRAM. To enable this, the SRAM is divided into 8KB banks that can be individually powered down. Banks that are powered down remain powered down in both active and low-power modes of operation, thereby limiting any unnecessary inrush current when the device transitions between active and retention-based low-power modes. The application can also disable one (or more) banks for a certain stage in the processing and enable it for another stage.

When a particular bank is disabled, reads to its address space return 0h, and writes are discarded. To prevent 'holes' in the memory map, if a particular bank is enabled, all the lower banks are also forced to enabled state. This ensures a contiguous memory map through the set of enabled banks instead of allowing a disabled bank to appear between enabled banks. For example:

- If there are eight banks in the device, values of 00111111 and 00000111 are acceptable.
- Values like 00010111 are not valid, and the resultant bank configuration is automatically set to 00011111.
- For example, for a 4-bank SRAM, the only allowed values are 0001, 0011, 0111, and 1111.

Bank 0 of the SRAM is always enabled and cannot be disabled. For all other banks, any enable or disable change results in the SRAM\_RDY bit of the SYS\_SRAM\_BANKEN register being set to 0 until the configuration change is effective. Any accesses to the SRAM is stalled during this time, and access resumes only after the SRAM banks are ready for read or write operations. This is handled transparently and does not require any code intervention. See the SRAM characteristics in the electrical specification for the SRAM bank enable or disable latency.

#### 6.4.2.2 SRAM Bank Retention Configuration and Backup Memory

The application can optimize the leakage power consumption of the SRAM in LPM3 and LPM4 modes of operation. To enable this, each SRAM bank can be individually configured for retention. Banks that are enabled for retention retain their data through the LPM3 and LPM4 modes. The application can also retain a subset of the enabled banks.

For example, the application may need 32KB of SRAM for its processing needs (four banks are kept enabled). However, of these four banks, only one bank may contain critical data that must be retained in LPM3 or LPM4, while the rest are powered off completely to minimize power consumption.

Bank 0 of the SRAM is always retained and cannot be powered down. Therefore, it also operates up as a possible backup memory in the LPM3, LPM4, and LPM3.5 modes of operation. In the case of LPM3 and LPM4 modes, the full 8KB of SRAM bank 0 is retained but in the case of LPM3.5 mode only 6KB of SRAM bank 0 is retained. The 2KB of SRAM bank 0 over the address range 0x2000\_0000 to 0x2000\_07FF is not retained in LPM3.5 mode.

#### 6.4.3 ROM

The MSP432P401x MCUs support 32KB of ROM, with the rest of the 1MB region reserved (for future upgrades). The lower 2KB of the ROM is reserved for TI internal purposes and accesses to this space returns an error response. The rest of the ROM is used for driver libraries.

##### NOTE

The entire ROM region returns an error response for write accesses. The lower 2KB of the ROM always returns an error response for any access.

#### 6.5 DMA

The MSP432P401x MCUs implement an 8-channel Arm  $\mu$ DMA. This allows eight simultaneously active channels for data transfer between memory and peripherals without needing to use the bandwidth of the CPU (thereby reducing power by idling the CPU when there is no data processing required). In addition, the DMA remains active in multiple low-power modes of operation, allowing for a very low power state in which data can be transferred at low rates.

For maximum flexibility, up to eight DMA event sources can map to any of the eight channels. This is controlled through configuration registers in the DMA. In addition, the DMA can generate up to four interrupt requests (described in [Section 6.5.2](#)). For details regarding configuration of the DMA, see the DMA chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#).

### 6.5.1 DMA Source Mapping

Each channel of the eight available channels has a control register that can select any of the device-level DMA sources as the final source for that corresponding channel. [Table 6-36](#) lists the sources available for mapping to each channel, based on the value of the Source Configuration (SRCCFG) register. The DMA transfers are initiated upon rising edge of the selected DMA source.

**Table 6-36. DMA Sources**

|           | SRCCFG = 0 | SRCCFG = 1  | SRCCFG = 2   | SRCCFG = 3   | SRCCFG = 4   | SRCCFG = 5   | SRCCFG = 6 | SRCCFG = 7              |
|-----------|------------|-------------|--------------|--------------|--------------|--------------|------------|-------------------------|
| Channel 0 | Reserved   | eUSCI_A0 TX | eUSCI_B0 TX0 | eUSCI_B3 TX1 | eUSCI_B2 TX2 | eUSCI_B1 TX3 | TA0CCR0    | AES256_Trigger0         |
| Channel 1 | Reserved   | eUSCI_A0 RX | eUSCI_B0 RX0 | eUSCI_B3 RX1 | eUSCI_B2 RX2 | eUSCI_B1 RX3 | TA0CCR2    | AES256_Trigger1         |
| Channel 2 | Reserved   | eUSCI_A1 TX | eUSCI_B1 TX0 | eUSCI_B0 TX1 | eUSCI_B3 TX2 | eUSCI_B2 TX3 | TA1CCR0    | AES256_Trigger2         |
| Channel 3 | Reserved   | eUSCI_A1 RX | eUSCI_B1 RX0 | eUSCI_B0 RX1 | eUSCI_B3 RX2 | eUSCI_B2 RX3 | TA1CCR2    | Reserved                |
| Channel 4 | Reserved   | eUSCI_A2 TX | eUSCI_B2 TX0 | eUSCI_B1 TX1 | eUSCI_B0 TX2 | eUSCI_B3 TX3 | TA2CCR0    | Reserved                |
| Channel 5 | Reserved   | eUSCI_A2 RX | eUSCI_B2 RX0 | eUSCI_B1 RX1 | eUSCI_B0 RX2 | eUSCI_B3 RX3 | TA2CCR2    | Reserved                |
| Channel 6 | Reserved   | eUSCI_A3 TX | eUSCI_B3 TX0 | eUSCI_B2 TX1 | eUSCI_B1 TX2 | eUSCI_B0 TX3 | TA3CCR0    | DMAE0<br>(External Pin) |
| Channel 7 | Reserved   | eUSCI_A3 RX | eUSCI_B3 RX0 | eUSCI_B2 RX1 | eUSCI_B1 RX2 | eUSCI_B0 RX3 | TA3CCR2    | Precision ADC           |

#### NOTE

Any source marked as Reserved is unused. It may be used for software-controlled DMA tasks, but typically it is reserved for enhancement purposes on future devices.

### 6.5.2 DMA Completion Interrupts

In the case of the Arm  $\mu$ DMA controller, it is usually the responsibility of software to maintain a list of channels that have completed their operation. To provide further flexibility, the MSP432P401x DMA supports four DMA completion interrupts, which are mapped in the following way:

- DMA\_INT0: Logical OR of all completion events except those that are already mapped to DMA\_INT1, DMA\_INT2, or DMA\_INT3.
- DMA\_INT1, DMA\_INT2, DMA\_INT3: Can be mapped to the DMA completion event of any of the eight channels.

#### NOTE

Software must make sure that DMA\_INT1, DMA\_INT2, and DMA\_INT3 are mapped to different channels, so that the same channel does not result in multiple interrupts at the NVIC.

### 6.5.3 DMA Access Privileges

The DMA has access to all of the memories and peripheral configuration interfaces of the device. If the device is configured for IP protection, DMA access to the flash is restricted to only bank 1 of the flash main and information memory regions. This restriction prevents the DMA from being used as an unauthorized access source into bank 0 of the flash, where secure data regions are housed.

## 6.6 Memory Map Access Details

The bus system on the MSP432P401x MCUs incorporates four masters, which can initiate various types of transactions:

- ICODE: Cortex-M4 instruction fetch bus. Accesses the Code zone only
- DCODE: Cortex-M4 data and literal load/store bus. Accesses the Code zone only. Debugger accesses to Code zone also appear on this bus.
- SBUS: Cortex-M4 data read and write bus. Accesses to all zones except Code zones and PPB memory space only. Debugger accesses to this space also appear on this bus.

- DMA: Access to all zones except the PPB memory space

#### NOTE

The PPB space is dedicated only to the Cortex-M4 Private Peripheral Bus.

### 6.6.1 Master and Slave Access Priority Settings

Table 6-37 lists all of the available masters (rows) and their access permissions to slaves (columns). If multiple masters can access one slave, the table lists access priorities if arbitration is required. A lower number in the table indicates a higher arbitration priority (the priority is always fixed).

**Table 6-37. Master and Slave Access Priority**

|       | FLASH MEMORY     | ROM | SRAM             | PERIPHERALS |
|-------|------------------|-----|------------------|-------------|
| ICODE | 3                | 2   | 4                | N/A         |
| DCODE | 2 <sup>(1)</sup> | 1   | 2                | N/A         |
| SBUS  | N/A              | N/A | 3                | 2           |
| DMA   | 1 <sup>(2)</sup> | N/A | 1 <sup>(3)</sup> | 1           |

- (1) Access from the DCODE to flash memory may be restricted if the device is operating in a secure mode.
- (2) Access from DMA to flash memory are restricted to Bank 1 if the device is operating in a secure mode with IP protection enabled. In such cases, access to Bank 0 returns an error response.
- (3) Although the SRAM is mapped to both Code and System spaces, accesses from DMA to SRAM must use only the System space. DMA accesses to SRAM in Code space will result in bus error.

### 6.6.2 Memory Map Access Response

Table 6-38 summarizes the access responses to the entire memory map of the MSP432P401x MCUs.

**Table 6-38. Memory Map Access Response**

| ADDRESS RANGE              | DESCRIPTION               | READ <sup>(1)</sup> | WRITE <sup>(1)</sup> | INSTRUCTION FETCH <sup>(1)</sup> |
|----------------------------|---------------------------|---------------------|----------------------|----------------------------------|
| 0x0000_0000 to 0x0003_FFFF | Flash Main Memory         | OK                  | OK <sup>(2)(3)</sup> | OK                               |
| 0x0004_0000 to 0x001F_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x0020_0000 to 0x0020_3FFF | Flash Information Memory  | OK                  | OK <sup>(3)</sup>    | OK                               |
| 0x0020_4000 to 0x00FF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x0100_0000 to 0x0100_FFFF | SRAM                      | OK                  | OK                   | OK                               |
| 0x0101_0000 to 0x01FF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x0200_0000 to 0x0200_03FF | ROM (Reserved)            | Error               | Error                | Error                            |
| 0x0200_0400 to 0x0200_7FFF | ROM                       | OK                  | Error                | OK                               |
| 0x0200_8000 to 0x1FFF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x2000_0000 to 0x2000_FFFF | SRAM                      | OK                  | OK                   | OK                               |
| 0x2001_0000 to 0x21FF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x2200_0000 to 0x23FF_FFFF | SRAM bit-band alias       | OK <sup>(4)</sup>   | OK                   | Error                            |
| 0x2400_0000 to 0x3FFF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x4000_0000 to 0x4001_FFFF | Peripheral                | OK                  | OK                   | Error                            |
| 0x4002_0000 to 0x41FF_FFFF | Reserved                  | Error               | Error                | Error                            |
| 0x4200_0000 to 0x43FF_FFFF | Peripheral bit-band alias | OK <sup>(4)</sup>   | OK                   | Error                            |
| 0x4400_0000 to 0xDFFF_FFFF | Reserved                  | Error               | Error                | Error                            |

- (1) A reserved memory region returns 0h on reads and instruction fetches. Writes to this region are ignored.
- (2) If the user memory address is part of a secure region, this access returns an error if it is initiated by an unauthorized source. For more details, see [Configuring Security and Bootloader \(BSL\) on MSP432P4xx](#).
- (3) Writes to this address are ignored if the sector has write protection enabled.
- (4) Reads from the bit-band region return 00h if the bit is clear and 01h if the bit is set.

**Table 6-38. Memory Map Access Response (continued)**

| ADDRESS RANGE              | DESCRIPTION                     | READ <sup>(1)</sup> | WRITE <sup>(1)</sup> | INSTRUCTION FETCH <sup>(1)</sup> |
|----------------------------|---------------------------------|---------------------|----------------------|----------------------------------|
| 0xE000_0000 to 0xE003_FFFF | Internal PPB <sup>(5)</sup>     | OK                  | OK                   | Error                            |
| 0xE004_0000 to 0xE004_0FFF | TPIU (External PPB)             | OK                  | OK                   | Error                            |
| 0xE004_1000 to 0xE004_1FFF | Reserved                        | Reserved            | Reserved             | Error                            |
| 0xE004_2000 to 0xE004_23FF | Reset Controller (External PPB) | OK                  | OK                   | Error                            |
| 0xE004_2400 to 0xE004_2FFF | Reserved                        | Reserved            | Reserved             | Error                            |
| 0xE004_3000 to 0xE004_33FF | SYSCTL (External PPB)           | OK                  | OK                   | Error                            |
| 0xE004_3400 to 0xE004_3FFF | Reserved                        | Reserved            | Reserved             | Error                            |
| 0xE004_4000 to 0xE004_43FF | SYSCTL (External PPB)           | OK                  | OK                   | Error                            |
| 0xE004_4400 to 0xE00F_EFFF | Reserved                        | Reserved            | Reserved             | Error                            |
| 0xE00F_F000 to 0xE00F_FFFF | ROM Table (External PPB)        | OK                  | OK                   | Error                            |
| 0xE010_0000 to 0xFFFF_FFFF | Reserved                        | Error               | Error                | Error                            |

(5) See the Cortex-M4 technical reference manual at [www.arm.com](http://www.arm.com) for details of the memory map of the internal PPB.

## 6.7 Interrupts

The Cortex-M4 processor on MSP432P401x MCUs implements an NVIC with 64 external interrupt lines and 8 levels of priority. From an application perspective, the interrupt sources at the device level are divided into two classes, the NMI and the User Interrupts. Internally, the CPU exception model handles the various exceptions (internal and external events including CPU instruction, memory, and bus fault conditions) in a fixed and configurable order of priority. For details on the handling of various exception priorities (including CPU reset and fault models), see the Arm-V7M architecture reference manual at [www.arm.com](http://www.arm.com).

### 6.7.1 NMI

The NMI input of the NVIC has the following possible sources:

- External NMI pin (if configured in NMI mode)
- Oscillator fault condition
- Power Supply System (PSS) generated interrupts
- Power Control Manager (PCM) generated interrupts

### 6.7.2 Device-Level User Interrupts

Table 6-39 lists the various interrupt sources and their connection to the NVIC inputs

#### NOTE

Some sources may have multiple interrupt conditions, in which case the appropriate interrupt status/flag register of the source must be examined to differentiate between the generating conditions.

**Table 6-39. NVIC Interrupts**

| NVIC INTERRUPT INPUT | SOURCE             | FLAGS IN SOURCE |
|----------------------|--------------------|-----------------|
| INTISR[0]            | PSS <sup>(1)</sup> |                 |
| INTISR[1]            | CS <sup>(1)</sup>  |                 |
| INTISR[2]            | PCM <sup>(1)</sup> |                 |
| INTISR[3]            | WDT_A              |                 |

(1) This source can also be mapped to the system NMI. See the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for more details.

**Table 6-39. NVIC Interrupts (continued)**

| NVIC INTERRUPT INPUT | SOURCE                  | FLAGS IN SOURCE                                                                                 |
|----------------------|-------------------------|-------------------------------------------------------------------------------------------------|
| INTISR[4]            | FPU_INT <sup>(2)</sup>  | Combined interrupt from flags in the FPSCR (part of Cortex-M4 FPU)                              |
| INTISR[5]            | FLCTL                   | Flash Controller interrupt flags                                                                |
| INTISR[6]            | COMP_E0                 | Comparator_E0 interrupt flags                                                                   |
| INTISR[7]            | COMP_E1                 | Comparator_E1 interrupt flags                                                                   |
| INTISR[8]            | Timer_A0                | TA0CCTL0.CCIFG                                                                                  |
| INTISR[9]            | Timer_A0                | TA0CCTLx.CCIFG (x = 1 to 4), TA0CTL.TAIFG                                                       |
| INTISR[10]           | Timer_A1                | TA1CCTL0.CCIFG                                                                                  |
| INTISR[11]           | Timer_A1                | TA1CCTLx.CCIFG (x = 1 to 4), TA1CTL.TAIFG                                                       |
| INTISR[12]           | Timer_A2                | TA2CCTL0.CCIFG                                                                                  |
| INTISR[13]           | Timer_A2                | TA2CCTLx.CCIFG (x = 1 to 4), TA2CTL.TAIFG                                                       |
| INTISR[14]           | Timer_A3                | TA3CCTL0.CCIFG                                                                                  |
| INTISR[15]           | Timer_A3                | TA3CCTLx.CCIFG (x = 1 to 4), TA3CTL.TAIFG                                                       |
| INTISR[16]           | eUSCI_A0                | UART or SPI mode TX, RX, and Status Flags                                                       |
| INTISR[17]           | eUSCI_A1                | UART or SPI mode TX, RX, and Status Flags                                                       |
| INTISR[18]           | eUSCI_A2                | UART or SPI mode TX, RX, and Status Flags                                                       |
| INTISR[19]           | eUSCI_A3                | UART or SPI mode TX, RX, and Status Flags                                                       |
| INTISR[20]           | eUSCI_B0                | SPI or I <sup>2</sup> C mode TX, RX, and Status Flags (I <sup>2</sup> C in multiple-slave mode) |
| INTISR[21]           | eUSCI_B1                | SPI or I <sup>2</sup> C mode TX, RX, and Status Flags (I <sup>2</sup> C in multiple-slave mode) |
| INTISR[22]           | eUSCI_B2                | SPI or I <sup>2</sup> C mode TX, RX, and Status Flags (I <sup>2</sup> C in multiple-slave mode) |
| INTISR[23]           | eUSCI_B3                | SPI or I <sup>2</sup> C mode TX, RX, and Status Flags (I <sup>2</sup> C in multiple-slave mode) |

| INTISR[32]           | DMA_INT2                | DMA completion interrupt2                                                                       |
| INTISR[33]           | DMA_INT1                | DMA completion interrupt1                                                                       |
| INTISR[34]           | DMA_INT0 <sup>(3)</sup> | DMA completion interrupt0                                                                       |
| INTISR[35]           | I/O Port P1             | P1IFG.x (x = 0 to 7)                                                                            |
| INTISR[36]           | I/O Port P2             | P2IFG.x (x = 0 to 7)                                                                            |
| INTISR[37]           | I/O Port P3             | P3IFG.x (x = 0 to 7)                                                                            |
| INTISR[38]           | I/O Port P4             | P4IFG.x (x = 0 to 7)                                                                            |
| INTISR[39]           | I/O Port P5             | P5IFG.x (x = 0 to 7)                                                                            |
| INTISR[40]           | I/O Port P6             | P6IFG.x (x = 0 to 7)                                                                            |
| INTISR[41]           | Reserved                |                                                                                                 |
| INTISR[42]           | Reserved                |                                                                                                 |
| INTISR[43]           | Reserved                |                                                                                                 |
| INTISR[44]           | Reserved                |                                                                                                 |
| INTISR[45]           | Reserved                |                                                                                                 |
| INTISR[46]           | Reserved                |                                                                                                 |
| INTISR[47]           | Reserved                |                                                                                                 |
| INTISR[48]           | Reserved                |                                                                                                 |

(2) The FPU of the Cortex-M4 can generate interrupts due to multiple floating point exceptions. It is the responsibility of software to process and clear the interrupt flags in the FPSCR.

(3) DMA\_INT0 has a different functionality from DMA\_INT1, DMA\_INT2, or DMA\_INT3. See [Section 6.5.2](#) for more details.

**Table 6-39. NVIC Interrupts (continued)**

| NVIC INTERRUPT INPUT | SOURCE   | FLAGS IN SOURCE |
|----------------------|----------|-----------------|
| INTISR[49]           | Reserved |                 |
| INTISR[50]           | Reserved |                 |
| INTISR[51]           | Reserved |                 |
| INTISR[52]           | Reserved |                 |
| INTISR[53]           | Reserved |                 |
| INTISR[54]           | Reserved |                 |
| INTISR[55]           | Reserved |                 |
| INTISR[56]           | Reserved |                 |
| INTISR[57]           | Reserved |                 |
| INTISR[58]           | Reserved |                 |
| INTISR[59]           | Reserved |                 |
| INTISR[60]           | Reserved |                 |
| INTISR[61]           | Reserved |                 |
| INTISR[62]           | Reserved |                 |
| INTISR[63]           | Reserved |                 |

**NOTE**

The Interrupt Service Routine (ISR) must ensure that the relevant interrupt flag in the source peripheral is cleared before returning from the ISR. If this is not done, the same interrupt may be incorrectly triggered again as a new event, even though the event has already been processed by the ISR. As there may be a few cycles of delay between the execution of the write command and the actual write reflecting in the interrupt flag register of the peripheral, the recommendation is to carry out the write and wait for a few cycles before exiting the ISR. Alternatively, the application can do an explicit read to ensure that the flag is cleared before exiting the ISR.

## 6.8 System Control

System Control comprises the modules that govern the overall behavior of the device, including power management, operating modes, clocks, reset handling, and user configuration settings.

### 6.8.1 Device Resets

The MSP432P401x MCUs support multiple classes of reset. Each class results in a different level of initiation of device logic, thus allowing the application developer to initiate different resets based reset requirements during code development and debug. The following subsections cover the classes of reset in the device

#### 6.8.1.1 Power On/Off Reset (POR)

The POR initiates a complete initialization of the application settings and device configuration information. This class of reset may be initiated either by the PSS, the PCM, the RSTn pin, the Clock System upon DCO external resistor short circuit fault, or the device emulation logic (through the debugger). From an application perspective, all sources of POR return the device to the same state of initialization.

**NOTE**

Depending on the source of the reset, the device may exhibit different wake-up latencies from the POR. This implementation enables optimization of the reset recovery time.

### 6.8.1.2 Reboot Reset

The Reboot Reset is identical to the POR and allows the application to emulate a POR class reset without needing to power cycle the device or activate the RSTn pin. It can also be initiated through the debugger and, hence, does not affect the debug connection to the device. On the other hand, a POR results in a debug disconnect.

### 6.8.1.3 Hard Reset

The Hard Reset resets all modules that are set up or modified by the application. This includes all peripherals and the nondebug logic of the Cortex-M4. The MSP432P401x MCUs support up to 16 sources of Hard Reset. [Table 6-40](#) lists the reset source allocation. The Reset Controller registers can be used to identify the source of reset in the device. For further details, see the *Reset Controller* chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#).

**Table 6-40. MSP432P401x Hard Reset Sources**

| RESET SOURCE<br>NUMBER | SOURCE                                         |
|------------------------|------------------------------------------------|
| 0                      | SYSRESETREQ (System reset output of Cortex-M4) |
| 1                      | WDT_A Time-out <sup>(1)</sup>                  |
| 2                      | WDT_A Password Violation <sup>(1)</sup>        |
| 3                      | FLCTL <sup>(2)</sup>                           |
| 4                      | Reserved <sup>(3)</sup>                        |
| 5                      | Reserved <sup>(3)</sup>                        |
| 6                      | Reserved <sup>(3)</sup>                        |
| 7                      | Reserved <sup>(3)</sup>                        |
| 8                      | Reserved <sup>(3)</sup>                        |
| 9                      | Reserved <sup>(3)</sup>                        |
| 10                     | Reserved <sup>(3)</sup>                        |
| 11                     | Reserved <sup>(3)</sup>                        |
| 12                     | Reserved <sup>(3)</sup>                        |
| 13                     | Reserved <sup>(3)</sup>                        |
| 14                     | CS <sup>(4)</sup>                              |
| 15                     | PCM <sup>(5)</sup>                             |

- (1) The WDT\_A generated resets can be mapped either as a Hard Reset or a Soft Reset.
- (2) The FLCTL can generate a reset if a voltage anomaly is detected that can corrupt only flash reads and not the rest of the system.
- (3) Reserved indicates that this source of Hard Reset is currently unused and left for future expansion.
- (4) The CS is technically not a source of a Hard Reset, but if a Hard Reset occurs during clock source or frequency changes, the CS can extend the reset to allow the clocks to settle before releasing the system. This reduces the chance of nondeterministic behavior.
- (5) The PCM is technically not a source of a Hard Reset, but if a Hard Reset causes power mode changes, the PCM can extend the reset to allow the system to settle before releasing the Reset. This reduces the chance of nondeterministic behavior.

#### 6.8.1.4 Soft Reset

The Soft Reset resets only the execution component of the system, which is the nondebug logic in the Cortex-M4 and the WDT\_A. This reset remains nonintrusive to all other peripherals and system components. The MSP432P401x MCUs support up to 16 sources of Soft Reset. Table 6-41 lists the reset source allocation. The Reset Controller registers can be used to identify the source of reset in the design. For further details, see the *Reset Controller* chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#).

**Table 6-41. MSP432P401x Soft Reset Sources**

| RESET SOURCE NUMBER | SOURCE                                            |
|---------------------|---------------------------------------------------|
| 0                   | CPU LOCKUP Condition (LOCKUP output of Cortex-M4) |
| 1                   | WDT_A Time-out <sup>(1)</sup>                     |
| 2                   | WDT_A Password Violation <sup>(1)</sup>           |
| 3                   | Reserved <sup>(2)</sup>                           |
| 4                   | Reserved <sup>(2)</sup>                           |
| 5                   | Reserved <sup>(2)</sup>                           |
| 6                   | Reserved <sup>(2)</sup>                           |
| 7                   | Reserved <sup>(2)</sup>                           |
| 8                   | Reserved <sup>(2)</sup>                           |
| 9                   | Reserved <sup>(2)</sup>                           |
| 10                  | Reserved <sup>(2)</sup>                           |
| 11                  | Reserved <sup>(2)</sup>                           |
| 12                  | Reserved <sup>(2)</sup>                           |
| 13                  | Reserved <sup>(2)</sup>                           |
| 14                  | Reserved <sup>(2)</sup>                           |
| 15                  | Reserved <sup>(2)</sup>                           |

(1) The WDT\_A generated resets can be mapped either as a Hard Reset or a Soft Reset.

(2) Reserved indicates that this source of Soft Reset is currently unused and left for future expansion.

#### NOTE

To support and enhance debug of reset conditions, the Reset Controller is located on the PPB of the device. This allows the Reset Controller to remain accessible even if the device is stuck in a Hard or Soft reset state. The Reset Controller permits overrides for Hard and Soft resets, thereby allowing an application to regain control of the device and isolate the cause of the stuck reset.

### 6.8.2 Power Supply System (PSS)

The PSS controls all the power supply related functionality of the device. It consists of the following components.

#### 6.8.2.1 VCCDET

The VCCDET monitors the input voltage applied at the DVCC and AVCC pins of the device. When the V<sub>CC</sub> is found to be below the operating range of the VCCDET trip points, it generates a brownout condition, thereby initiating a device reset (POR class reset).

### 6.8.2.2 Supply Supervisor and Monitor for High Side (SVSMH)

The SVSMH supervises and monitors the  $V_{CC}$ . SVSMH has a programmable threshold setting and can be used by the application to generate a reset or an interrupt if the  $V_{CC}$  dips below the desired threshold. In supervisor mode, the SVSMH generates a device reset (POR class reset). In monitor mode, the SVSMH generates an interrupt. The SVSMH can also be disabled if monitoring and supervision of the supply voltage are not required (offers further power savings).

### 6.8.2.3 Core Voltage Regulator

The MSP432P401x MCUs can be programmed to operate either with an LDO or with a DC-DC as the voltage regulator for the digital logic in the core domain of the device. The DC-DC offers significant boost in power efficiency for high-current high-performance applications. The LDO is a highly efficient regulator that offers power advantages at lower  $V_{CC}$  ranges and in the ultra-low-power modes of operation.

The core operating voltage (output of the LDO or DC-DC) is automatically set by the device depending on the selected operating mode of the device (see [Table 6-42](#) for further details). The device offers seamless switching between LDO and DC-DC operating modes and also implements a seamless DC-DC fail-safe mechanism.

## 6.8.3 Power Control Manager (PCM)

The PCM controls the operating modes of the device and the switching between the modes. This is controlled by the application, which can choose modes to meet its power and performance requirements. [Table 6-42](#) lists the operating modes of the device.

**Table 6-42. MSP432P401x Operating Modes**

| OPERATING MODE   | DESCRIPTION                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| AM_LDO_VCORE0    | LDO based active mode, normal performance, core voltage level 0                                                 |
| LPM0_LDO_VCORE0  | Same as above, except that CPU is OFF (no code execution)                                                       |
| AM_LDO_VCORE1    | LDO based active mode, maximum performance, core voltage level 1                                                |
| LPM0_LDO_VCORE1  | Same as above, except that CPU is OFF (no code execution)                                                       |
| AM_DCDC_VCORE0   | DC-DC based active mode, normal performance, core voltage level 0                                               |
| LPM0_DCDC_VCORE0 | Same as above, except that CPU is OFF (no code execution)                                                       |
| AM_DCDC_VCORE1   | DC-DC based active mode, maximum performance, core voltage level 1                                              |
| LPM0_DCDC_VCORE1 | Same as above, except that CPU is OFF (no code execution)                                                       |
| AM_LF_VCORE0     | LDO based low-frequency active mode, core voltage level 0                                                       |
| LPM0_LF_VCORE0   | Same as above, except that CPU is OFF (no code execution)                                                       |
| AM_LF_VCORE1     | LDO based low-frequency active mode, core voltage level 1                                                       |
| LPM0_LF_VCORE1   | Same as above, except that CPU is OFF (no code execution)                                                       |
| LPM3_VCORE0      | LDO based low-power mode with full state retention, core voltage level 0, RTC and WDT can be active             |
| LPM3_VCORE1      | LDO based low-power mode with full state retention, core voltage level 1, RTC and WDT can be active             |
| LPM4_VCORE0      | LDO based low-power mode with full state retention, core voltage level 0, all peripherals disabled.             |
| LPM4_VCORE1      | LDO based low-power mode with full state retention, core voltage level 1, all peripherals disabled              |
| LPM3.5           | LDO based low-power mode, core voltage level 0, no retention of peripheral registers, RTC and WDT can be active |
| LPM4.5           | Core voltage turned off, wake-up only through pin reset or wake-up capable I/Os                                 |

## 6.8.4 Clock System (CS)

The CS contains the sources of the various clocks in the device. It also controls the mapping between the sources and the different clocks in the device.

### 6.8.4.1 LFXT

The LFXT supports 32.768 kHz low-frequency crystals.

### 6.8.4.2 HFXT

The HFXT supports high-frequency crystals up to 48 MHz.

### 6.8.4.3 DCO

The DCO is a power-efficient tunable internal oscillator that generates up to 48 MHz. The DCO also supports a high-precision mode when using an external precision resistor.

### 6.8.4.4 Very Low-Power Low-Frequency Oscillator (VLO)

The VLO is an ultra-low-power internal oscillator that generates a low-accuracy clock at typical frequency of 9.4 kHz.

### 6.8.4.5 Low-Frequency Reference Oscillator (REFO)

The REFO can be used as an alternate low-power lower-accuracy source of a 32.768 kHz clock instead of the LFXT. The REFO can also be programmed to generate a 128 kHz clock.

### 6.8.4.6 Module Oscillator (MODOSC)

The MODOSC is an internal clock source that has a very low latency wake-up time. It is factory-calibrated to a frequency of 25 MHz. The MODOSC is typically used to supply a 'clock on request' to different modules. It can be used as a clock source for ADC operation at 1 Msps sampling rate.

### 6.8.4.7 System Oscillator (SYSOSC)

The SYSOSC is an internal clock source that is factory calibrated to a frequency of 5 MHz. It can be used as a clock source for ADC operation at 200 ksps sampling rate. In addition, the SYSOSC is also used for timing of various system-level control and management operations.

### 6.8.4.8 Fail-Safe Mechanisms

All clock sources that operate with external components have a built-in fail-safe mechanism that automatically switches to the relevant backup source, thereby ensuring that spurious or unstable clocks never impact the device operation. [Table 6-43](#) shows the different types of clock source faults and the corresponding fail-safe clocks.

**Table 6-43. Fail-Safe Clocks**

| Fault Type                               | Fail-Safe Clock                     |
|------------------------------------------|-------------------------------------|
| LFXT oscillator fault                    | REFO clock                          |
| HFXT oscillator fault                    | SYSOSC clock                        |
| DCO external resistor open circuit fault | DCO clock in internal resistor mode |

## 6.8.5 System Controller (SYSCTL)

The SYSCTL is a set of various miscellaneous features of the device, including SRAM bank configuration, RSTn/NMI function selection, and peripheral halt control. In addition, the SYSCTL enables device security features like JTAG and SWD lock and IP protection, which can be used to protect unauthorized accesses either to the entire device memory map or to certain selected regions of the flash. See the *System Controller* chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for more details.

### NOTE

As is the case with the Cortex-M4 system control registers (in the internal PPB space), the System Controller module registers are mapped to the Cortex-M4 external PPB. This keeps the System Controller module accessible even when Hard or Soft resets are active.

## 6.9 Peripherals

### 6.9.1 Digital I/O

Up to 10 8-bit I/O ports are implemented:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Edge-selectable interrupt capability is available on ports P1 to P6.
- Wake-up capability from LPM3, LPM4, LPM3.5, and LPM4.5 modes on ports P1 to P6.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise or in pairs (16-bit widths).
- Capacitive-touch functionality is supported on all pins of ports P1 to P10 and PJ.
- Four 20-mA high-drive I/Os on pins P2.0 to P2.3.
- Glitch filtering capability on selected digital I/Os.

#### 6.9.1.1 Glitch Filtering on Digital I/Os

Some of the interrupt and wake-up capable digital I/Os can suppress glitches through the use of analog glitch filter to prevent unintentional interrupt or wake-up during device operation. The analog filter suppresses a minimum of 250-ns wide glitches. The glitch filter on these selected digital I/Os is enabled by default. If the glitch filtering capability is not required in the application, it can be bypassed using the SYS\_DIO\_GLTFILT\_CTL register. When GLTFILT\_EN bit in this register is cleared, the glitch filters on all the digital I/Os are bypassed. The glitch filter is automatically bypassed on a digital I/O when it is configured for peripheral or analog functionality by programming the respective PySEL0.x and PySEL1.x registers.

### NOTE

The glitch filter is implemented on the following digital I/Os on MSP432P401x MCUs: P1.0, P1.4, P1.5, P3.0, P3.4, P3.5, P6.6, and P6.7.

## 6.9.2 Port Mapping Controller (PMAPCTL)

The port mapping controller allows flexible and reconfigurable mapping of digital functions.

### 6.9.2.1 Port Mapping Definitions

The port mapping controller on MSP432P401x MCUs allows reconfigurable mapping of digital functions on ports P2, P3, and P7. [Table 6-44](#) lists the available mappings. [Table 6-45](#) lists the default settings for all pins that support port mapping.

**Table 6-44. Port Mapping Mnemonics and Functions**

| VALUE | PxMAPy MNEMONIC | INPUT PIN FUNCTION                                                             | OUTPUT PIN FUNCTION          |
|-------|-----------------|--------------------------------------------------------------------------------|------------------------------|
| 0     | PM_NONE         | None                                                                           | DVSS                         |
| 1     | PM_UCA0CLK      | eUSCI_A0 clock input/output (direction controlled by eUSCI)                    |                              |
| 2     | PM_UCA0RXD      | eUSCI_A0 UART RXD (direction controlled by eUSCI – Input)                      |                              |
|       | PM_UCA0SOMI     | eUSCI_A0 SPI slave out master in (direction controlled by eUSCI)               |                              |
| 3     | PM_UCA0TXD      | eUSCI_A0 UART TXD (direction controlled by eUSCI – Output)                     |                              |
|       | PM_UCA0SIMO     | eUSCI_A0 SPI slave in master out (direction controlled by eUSCI)               |                              |
| 4     | PM_UCB0CLK      | eUSCI_B0 clock input/output (direction controlled by eUSCI)                    |                              |
| 5     | PM_UCB0SDA      | eUSCI_B0 I <sup>2</sup> C data (open drain and direction controlled by eUSCI)  |                              |
|       | PM_UCB0SIMO     | eUSCI_B0 SPI slave in master out (direction controlled by eUSCI)               |                              |
| 6     | PM_UCB0SCL      | eUSCI_B0 I <sup>2</sup> C clock (open drain and direction controlled by eUSCI) |                              |
|       | PM_UCB0SOMI     | eUSCI_B0 SPI slave out master in (direction controlled by eUSCI)               |                              |
| 7     | PM_UCA1STE      | eUSCI_A1 SPI slave transmit enable (direction controlled by eUSCI)             |                              |
| 8     | PM_UCA1CLK      | eUSCI_A1 clock input/output (direction controlled by eUSCI)                    |                              |
| 9     | PM_UCA1RXD      | eUSCI_A1 UART RXD (direction controlled by eUSCI – Input)                      |                              |
|       | PM_UCA1SOMI     | eUSCI_A1 SPI slave out master in (direction controlled by eUSCI)               |                              |
| 10    | PM_UCA1TXD      | eUSCI_A1 UART TXD (direction controlled by eUSCI – Output)                     |                              |
|       | PM_UCA1SIMO     | eUSCI_A1 SPI slave in master out (direction controlled by eUSCI)               |                              |
| 11    | PM_UCA2STE      | eUSCI_A2 SPI slave transmit enable (direction controlled by eUSCI)             |                              |
| 12    | PM_UCA2CLK      | eUSCI_A2 clock input/output (direction controlled by eUSCI)                    |                              |
| 13    | PM_UCA2RXD      | eUSCI_A2 UART RXD (direction controlled by eUSCI – Input)                      |                              |
|       | PM_UCA2SOMI     | eUSCI_A2 SPI slave out master in (direction controlled by eUSCI)               |                              |
| 14    | PM_UCA2TXD      | eUSCI_A2 UART TXD (direction controlled by eUSCI – Output)                     |                              |
|       | PM_UCA2SIMO     | eUSCI_A2 SPI slave in master out (direction controlled by eUSCI)               |                              |
| 15    | PM_UCB2STE      | eUSCI_B2 SPI slave transmit enable (direction controlled by eUSCI)             |                              |
| 16    | PM_UCB2CLK      | eUSCI_B2 clock input/output (direction controlled by eUSCI)                    |                              |
| 17    | PM_UCB2SDA      | eUSCI_B2 I <sup>2</sup> C data (open drain and direction controlled by eUSCI)  |                              |
|       | PM_UCB2SIMO     | eUSCI_B2 SPI slave in master out (direction controlled by eUSCI)               |                              |
| 18    | PM_UCB2SCL      | eUSCI_B2 I <sup>2</sup> C clock (open drain and direction controlled by eUSCI) |                              |
|       | PM_UCB2SOMI     | eUSCI_B2 SPI slave out master in (direction controlled by eUSCI)               |                              |
| 19    | PM_TA0CCR0A     | TA0 CCR0 capture input CCI0A                                                   | TA0 CCR0 compare output Out0 |
| 20    | PM_TA0CCR1A     | TA0 CCR1 capture input CCI1A                                                   | TA0 CCR1 compare output Out1 |
| 21    | PM_TA0CCR2A     | TA0 CCR2 capture input CCI2A                                                   | TA0 CCR2 compare output Out2 |
| 22    | PM_TA0CCR3A     | TA0 CCR3 capture input CCI3A                                                   | TA0 CCR3 compare output Out3 |
| 23    | PM_TA0CCR4A     | TA0 CCR4 capture input CCI4A                                                   | TA0 CCR4 compare output Out4 |
| 24    | PM_TA1CCR1A     | TA1 CCR1 capture input CCI1A                                                   | TA1 CCR1 compare output Out1 |
| 25    | PM_TA1CCR2A     | TA1 CCR2 capture input CCI2A                                                   | TA1 CCR2 compare output Out2 |
| 26    | PM_TA1CCR3A     | TA1 CCR3 capture input CCI3A                                                   | TA1 CCR3 compare output Out3 |
| 27    | PM_TA1CCR4A     | TA1 CCR4 capture input CCI4A                                                   | TA1 CCR4 compare output Out4 |

**Table 6-44. Port Mapping Mnemonics and Functions (continued)**

| VALUE                    | PxMAPy MNEMONIC | INPUT PIN FUNCTION                                                                                                         | OUTPUT PIN FUNCTION  |
|--------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------|----------------------|
| 28                       | PM_TA0CLK       | Timer_A0 external clock input                                                                                              | None                 |
|                          | PM_C0OUT        | None                                                                                                                       | Comparator-E0 output |
| 29                       | PM_TA1CLK       | Timer_A1 external clock input                                                                                              | None                 |
|                          | PM_C1OUT        | None                                                                                                                       | Comparator-E1 output |
| 30                       | PM_DMAE0        | DMAE0 input                                                                                                                | None                 |
|                          | PM_SMCLK        | None                                                                                                                       | SMCLK                |
| 31 (0FFh) <sup>(1)</sup> | PM_ANALOG       | Disables the output driver and the input Schmitt-trigger to prevent parasitic cross currents when applying analog signals. |                      |

(1) The value of the PM\_ANALOG mnemonic is 31. The port mapping registers are 5 bits wide, and the upper bits are ignored, which results in a read value of 31.

**Table 6-45. Default Mapping**

| PIN NAME                          | PxMAPy MNEMONIC            | INPUT PIN FUNCTION                                                                                                                                  | OUTPUT PIN FUNCTION          |

### 6.9.3 Timer\_A

Timers TA0, TA1, TA2 and TA3 are 16-bit timers/counters (Timer\_A type) with five capture/compare registers each. Each timer supports multiple capture/compares, PWM outputs, and interval timing. Each has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

#### 6.9.3.1 Timer\_A Signal Connection Tables

Table 6-46 to Table 6-49 list the interface signals of the Timer\_A modules on the device and connections of the interface signals to the corresponding pins or internal signals. The following rules apply to the naming conventions used.

- The first column lists the device level pin or internal signal that sources the clocks and/or triggers into the Timer. The default assumption is that these are pins, unless specifically marked as (internal). Nomenclature used for internal signals is as follows:
  - CxOUT: output from Comparator x.
  - TAx\_Cy: Output from Timer x, Capture/Compare module y.
- The second column lists the input signals of the Timer module.
- The third column lists the submodule of the Timer and also implies the functionality (Timer, Capture (Inputs or Triggers), or Compare (Outputs or PWM)).
- The fourth column lists the output signals of the Timer module.
- The fifth column lists the device-level pin or internal signal that is driven by the outputs of the Timer. The default assumption is that these are pins, unless specifically marked as (internal).

---

#### NOTE

The pin names listed in the tables are the complete names. It is the responsibility of the software to ensure that the pin is used in the intended mode for the targeted Timer functionality.

---

---

#### NOTE

Internal signals that are sourced by the Timer outputs may connect to other modules (for example, other timers or the ADC) in the device (as trigger sources).

---

#### 6.9.4 Timer32

Timer32 is an Arm dual 32-bit timer module. It contains two 32-bit timers, each of which can be configured as two independent 16-bit timers. The two timers can generate independent events or a combined event, which can be processed according to application requirements. Timer32 runs out of the same clock as the Cortex-M4 CPU.

#### 6.9.5 Enhanced Universal Serial Communication Interface (eUSCI)

The eUSCI modules are used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3-pin or 4-pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baud-rate detection, and IrDA.

The eUSCI\_An module provides support for SPI (3-pin or 4-pin), UART, enhanced UART, and IrDA.

The eUSCI\_Bn module provides support for SPI (3-pin or 4-pin) and I<sup>2</sup>C.

The MSP432P401x MCUs offer up to four eUSCI\_A and four eUSCI\_B modules.

#### 6.9.6 Real-Time Clock (RTC\_C)

The RTC\_C module contains an integrated real-time clock. It integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC\_C also supports flexible alarm functions, offset calibration, and temperature compensation. The RTC\_C operation is available in LPM3 and LPM3.5 modes to minimize power consumption.

### 6.9.7 Watchdog Timer (WDT\_A)

The primary function of the WDT\_A module is to perform a controlled system restart if a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

#### CAUTION

The WDT must be set to interval mode before transitioning into the LPM3 or LPM3.5 modes of operation. This allows the WDT event to wake the device and return it to active modes of operation. Using the WDT in watchdog mode may result in nondeterministic behavior due to the generated reset.

The watchdog can generate a reset on either a time-out or a password violation. This reset can be configured to generate either a Hard Reset or a Soft Reset into the system. See the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for more details. The WDT should typically be configured to generate a Hard reset into the system. A Soft reset resets the CPU but leaves the rest of the system and peripherals unaffected. As a result, if the WDT is configured to generate a Soft reset, the application should assume responsibility for the fact that a Soft reset can corrupt an ongoing transaction from the CPU into the system.

Table 6-50 lists the clocks that can be selected as the source for the WDT\_A module.

**Table 6-50. WDT\_A Clocks**

| WDTSEL | NORMAL OPERATION<br>(WATCHDOG AND INTERVAL TIMER MODE) |
|--------|--------------------------------------------------------|
| 00     | SMCLK                                                  |
| 01     | ACLK                                                   |
| 10     | VLOCLK                                                 |
| 11     | BCLK                                                   |

### 6.9.8 Precision ADC

The Precision ADC (analog-to-digital converter) module can achieve up to 16-bit precision with software over-sampling, up to 1-Msps sampling rate with differential and single-ended inputs. The module implements a native 14-bit SAR core, sample-and-hold circuit, reference generator, and a conversion result buffer. The window comparators with lower and upper limits allow CPU-independent result monitoring through different window comparator interrupt flags.

Table 6-51 summarizes the available Precision ADC external trigger sources.

**Table 6-51. Precision ADC Trigger Signal Connections**

| ADC14SHSx |         | CONNECTED TRIGGER SOURCE |
|-----------|---------|--------------------------|
| BINARY    | DECIMAL |                          |
| 000       | 0       | Software (ADC14SC)       |
| 001       | 1       | TA0_C1                   |
| 010       | 2       | TA0_C2                   |
| 011       | 3       | TA1_C1                   |
| 100       | 4       | TA1_C2                   |
| 101       | 5       | TA2_C1                   |
| 110       | 6       | TA2_C2                   |
| 111       | 7       | TA3_C1                   |

Table 6-52, Table 6-53, and Table 6-54 list the available multiplexing between internal and external analog inputs of the Precision ADC.

**Table 6-52. Precision ADC Channel Mapping on 100-Pin PZ Devices**

| PRECISION ADC CHANNEL | EXTERNAL CHANNEL SOURCE (CONTROL BIT = 0) | INTERNAL CHANNEL SOURCE (CONTROL BIT = 1) <sup>(1)</sup> | CONTROL BIT <sup>(2)</sup> |
|-----------------------|-------------------------------------------|----------------------------------------------------------|----------------------------|
| Channel 23            | A23                                       | Battery Monitor                                          | ADC14BATMAP                |
| Channel 22            | A22                                       | Temperature Sensor                                       | ADC14TCMAP                 |
| Channel 21            | A21                                       | N/A (Reserved)                                           | ADC14CH0MAP                |
| Channel 20            | A20                                       | N/A (Reserved)                                           | ADC14CH1MAP                |
| Channel 19            | A19                                       | N/A (Reserved)                                           | ADC14CH2MAP                |
| Channel 18            | A18                                       | N/A (Reserved)                                           | ADC14CH3MAP                |

- (1) If an internal source is marked as *N/A* or *Reserved*, it indicates that only the external source is available for that channel.
- (2) See the Precision ADC chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for details on the registers that contain the control bits listed in the table.

**Table 6-53. Precision ADC Channel Mapping on 80-Pin ZXH Devices**

| PRECISION ADC CHANNEL | EXTERNAL CHANNEL SOURCE (CONTROL BIT = 0) <sup>(1)</sup> | INTERNAL CHANNEL SOURCE (CONTROL BIT = 1) <sup>(2)</sup> | CONTROL BIT <sup>(3)</sup> |
|-----------------------|----------------------------------------------------------|----------------------------------------------------------|----------------------------|
| Channel 23            | N/A                                                      | Battery Monitor                                          | ADC14BATMAP                |
| Channel 22            | N/A                                                      | Temperature Sensor                                       | ADC14TCMAP                 |
| Channel 15            | A15                                                      | N/A (Reserved)                                           | ADC14BATMAP                |
| Channel 14            | A14                                                      | N/A (Reserved)                                           | ADC14TCMAP                 |
| Channel 13            | A13                                                      | N/A (Reserved)                                           | ADC14CH0MAP                |
| Channel 12            | A12                                                      | N/A (Reserved)                                           | ADC14CH1MAP                |
| Channel 11            | A11                                                      | N/A (Reserved)                                           | ADC14CH2MAP                |
| Channel 10            | A10                                                      | N/A (Reserved)                                           | ADC14CH3MAP                |

- (1) If an external source is marked as *N/A*, it indicates that only the internal source is available for that channel.
- (2) If an internal source is marked as *N/A* or *Reserved*, it indicates that only the external source is available for that channel.
- (3) See the Precision ADC chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for details on the registers that contain the control bits listed in the table.

**Table 6-54. Precision ADC Channel Mapping on 64-Pin RGC Devices**

| PRECISION ADC CHANNEL | EXTERNAL CHANNEL SOURCE (CONTROL BIT = 0) <sup>(1)</sup> | INTERNAL CHANNEL SOURCE (CONTROL BIT = 1) <sup>(2)</sup> | CONTROL BIT <sup>(3)</sup> |
|-----------------------|----------------------------------------------------------|----------------------------------------------------------|----------------------------|
| Channel 23            | N/A                                                      | Battery Monitor                                          | ADC14BATMAP                |
| Channel 22            | N/A                                                      | Temperature Sensor                                       | ADC14TCMAP                 |
| Channel 11            | A11                                                      | N/A (Reserved)                                           | ADC14BATMAP                |
| Channel 10            | A10                                                      | N/A (Reserved)                                           | ADC14TCMAP                 |
| Channel 9             | A9                                                       | N/A (Reserved)                                           | ADC14CH0MAP                |
| Channel 8             | A8                                                       | N/A (Reserved)                                           | ADC14CH1MAP                |
| Channel 7             | A7                                                       | N/A (Reserved)                                           | ADC14CH2MAP                |
| Channel 6             | A6                                                       | N/A (Reserved)                                           | ADC14CH3MAP                |

- (1) If an external source is marked as *N/A*, it indicates that only the internal source is available for that channel.
- (2) If an internal source is marked as *N/A* or *Reserved*, it indicates that only the external source is available for that channel.
- (3) See the *Precision ADC* chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#) for details on the registers that contain the control bits listed in the table.

### 6.9.9 Comparator\_E (COMP\_E)

The primary function of the COMP\_E module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

There are two COMP\_E modules available on the MSP432P401x MCUs.

### 6.9.10 Shared Reference (REF\_A)

The REF\_A generates all the critical reference voltages that can be used by the various analog peripherals in the device. The reference voltage from REF\_A can also be output on a device pin for external use.

### 6.9.11 CRC32

The CRC32 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. It supports both a CRC32 and a CRC16 computation.

- The CRC16 computation signature is based on the CRC16-CCITT standard.
- The CRC32 computation signature is based on the CRC32-ISO3309 standard.

### 6.9.12 AES256 Accelerator

The AES accelerator module performs encryption and decryption of 128-bit data with 128-, 192-, or 256-bit keys according to the Advanced Encryption Standard (AES) (FIPS PUB 197) in hardware.

### 6.9.13 True Random Seed

The Device Descriptor Information (TLV) section contains a 128-bit true random seed that can be used to implement a deterministic random number generator.

## 6.10 Code Development and Debug

The MSP432P401x MCUs support various methods through which the user can carry out code development and debug on the device.

### 6.10.1 JTAG and SWD Based Development, Debug, and Trace

The device supports both 4-pin JTAG and the 2-pin SWD modes of operation. The device is compatible with all standard Cortex-M4 debuggers available in the market today. The debug logic in the device has been designed to remain minimally intrusive to the application state. In low-power modes, the debugger can override the state of the PSS, thereby gaining access to debug and trace features.

In 2-pin SWD mode, the TDO pin can export serial wire trace output (SWO) data. In addition, the TDI and TDO pins of the device can be reassigned as user I/Os. See [Section 6.12.22](#) and [Section 6.12.23](#) for more details.

#### NOTE

If the device has activated debug security, debugger access into the device is completely disabled. The debugger, however, is can still scan the run/halt state of the CPU. Further control of and visibility into the device is possible only after initiating a mass erase of the device flash contents.

### 6.10.2 Peripheral Halt Control

The Peripheral Halt Control register in the System Controller module allows the user independent control over the functionality of device peripherals during code development and debug. When the CPU is halted, the bits in this register can control whether the corresponding peripheral freezes its operation (such as incrementing, transmit, and receive) or continues its operation (debug remains nonintrusive). The registers of the peripheral remain accessible without regard to the values in the Peripheral Halt Control register.

### 6.10.3 Bootloader (BSL)

The BSL enables users to program flash or SRAM on the device using a UART, I<sup>2</sup>C, or SPI serial interface. Access to the device memory through the BSL is protected by a user-defined password. [Table 6-55](#) lists the device pins that are required to use the BSL.

**Table 6-55. BSL Pins and Functions**

| DEVICE PIN | BSL FUNCTION            |
|------------|-------------------------|
| P1.2       | UART BSLRXD             |
| P1.3       | UART BSLTXD             |
| P1.4       | SPI BSLSTE              |
| P1.5       | SPI BSLCLK              |
| P1.6       | SPI BSLSIMO             |
| P1.7       | SPI BSLSOMI             |
| P3.6       | I <sup>2</sup> C BSLSDA |
| P3.7       | I <sup>2</sup> C BSLSCL |

The BSL is invoked under any of the following conditions.

- Flash main memory is erased
- Hardware invocation of BSL
- Software-based API calls to BSL functions

The user can perform hardware invocation of BSL using any pin of ports P1, P2, or P3. The pin selected for this purpose should not be same as one used for BSL communication. The user can configure the device pin and its polarity through the flash boot-override mailbox. The BSL can then be invoked upon a power cycle or POR reset event with the configured pin.

For the complete description of the BSL features and its implementation, see the [MSP432P401R Bootloader \(BSL\) User's Guide](#).

### 6.10.4 Device Security

The MSP432P401xx MCUs offer the following two types of device security for the user application code programmed on to the device.

- JTAG and SWD Lock
- IP Protection

JTAG and SWD lock as the name indicates locks the JTAG and SWD interface of the device. IP protection is useful for protection of customer software IP, for example, in multiple-vendor development scenarios. Up to four IP-protected zones with configurable start address and size are supported. The security configurations of the device are done using the flash boot-override mailbox.

Also the SYCTL module provides infrastructure for encrypted in-field updates to the application code on devices that are JTAG and SWD locked or have defined IP-protection zones. For complete details of the device security features, see the *System Controller (SYCTL)* chapter in the [MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual](#).

## 6.11 Performance Benchmarks

The MSP432P401xx MCUs achieve the following performance benchmarks under the given software configurations and profile configurations. These performance benchmarks were measured with system supply voltage of 2.97 V at an ambient temperature of 25°C.

### 6.11.1 ULPBench Performance: 192.3 ULPMark-CP

[Table 6-56](#) shows the software configuration for this performance benchmark. [Table 6-57](#) shows the profile configuration.

**Table 6-56. Software Configuration**

| ITEMS                          | DETAILS                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------|
| Compiler Name and Version      | IAR EWARM v7.50.3                                                                   |
| Compiler Flags                 | --endian=little --cpu=Cortex-M4F -e --fpu=VFPv4_sp -Ohs --no_size_constraints --mfc |
| ULPBench Profile and Version   | v1.1.X                                                                              |
| EnergyMonitor Software Version | 1.1.3                                                                               |

**Table 6-57. Profile Configuration**

| CONFIGURATION                   | DETAILS                  |
|---------------------------------|--------------------------|
| Wakeup Timer Module             | RTC                      |
| Wakeup Timer Clock Source       | External Crystal         |
| Wakeup Timer Frequency [Hz]     | 32768 Hz                 |
| Wakeup Timer Accuracy [ppm]     | 20 ppm                   |
| Active Power Mode Name          | Active Mode              |
| Active Mode Clock Configuration | CPU: 16 MHz, RTC: 32 KHz |
| Active Mode Voltage Integrity   | 1.62 V                   |
| Inactive Power Mode Name        | LPM3                     |
| Inactive Clock Configuration    | CPU: OFF, RTC: 32 kHz    |
| Inactive Mode Voltage Integrity | 1.62 V                   |

### 6.11.2 CoreMark/MHz Performance: 3.41

Table 6-58 shows the software configuration for this performance benchmark. Table 6-59 shows the profile configuration.

**Table 6-58. Software Configuration**

| ITEMS                        | DETAILS                                                                           |
|------------------------------|-----------------------------------------------------------------------------------|
| Compiler Name and Version    | IAR EWARM v6.70.3                                                                 |
| Compiler Flags               | --no_size_constraints --debug --endian=little --cpu=Cortex-M4F -e --fpu=None -Ohs |
| CoreMark Profile and Version | v1.0                                                                              |

**Table 6-59. Profile Configuration**

| CONFIGURATION                   | DETAILS     |
|---------------------------------|-------------|
| Active Power Mode Name          | Active Mode |
| Active Mode Clock Configuration | CPU: 3 MHz  |
| Active Mode Voltage Integrity   | 1.62 V      |

### 6.11.3 DMIPS/MHz (Dhrystone 2.1) Performance: 1.22

Table 6-60 shows the software configuration for this performance benchmark. Table 6-61 shows the profile configuration.

**Table 6-60. Software Configuration**

| ITEMS                         | DETAILS                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------|
| Compiler Name and Version     | Keil uVision Arm Compiler v5.06 (build 20)                                                                   |
| Compiler Flags                | -c --cpu Cortex-M4.fp -g -O3 -Otime --apcs=interwork --asm --interleave --asm_dir --no_inline --no_multifile |
| Dhrystone Profile and Version | v2.1                                                                                                         |

**Table 6-61. Profile Configuration**

| CONFIGURATION                   | DETAILS     |
|---------------------------------|-------------|
| Active Power Mode Name          | Active Mode |
| Active Mode Clock Configuration | CPU: 3 MHz  |
| Active Mode Voltage Integrity   | 1.62 V      |

## 6.12 Input/Output Diagrams

### 6.12.1 Port P1 (P1.0 to P1.7) Input/Output With Schmitt Trigger

Figure 6-7 shows the port diagram. Table 6-62 summarizes the selection of the pin functions.

Figure 6-7. Py.x/USCI Pin Diagram

**Table 6-62. Port P1 (P1.0 to P1.7) Pin Functions**

| PIN NAME (P1.x)       | x | FUNCTION         | CONTROL BITS OR SIGNALS <sup>(1)</sup> |          |          |

|                              |   | TA2.CCI2A                             | 0                                      | 0        | 1        |
|                              |   | TA2.2                                 | 1                                      |          |          |
|                              |   | N/A                                   | 0                                      | 1        | 0        |
|                              |   | DVSS                                  | 1                                      |          |          |
|                              |   | VREF-, VeREF-, C1.6 <sup>(2)(3)</sup> | X                                      | 1        | 1        |

(1) X = don't care

(2) Setting P5SEL1.x and P5SEL0.x disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals.

(3) Setting the CEPD.q bit of the comparator disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the C1.q input pin to the comparator multiplexer with the CEIPSEL or CEIMSEL bits automatically disables the output driver and input buffer for that pin, regardless of the state of the associated CEPD.q bit.

### 6.12.15 Port P6 (P6.2 to P6.5) Input/Output With Schmitt Trigger

Figure 6-11 shows the port diagram. Table 6-76 summarizes the selection of the pin functions.

Functional representation only.

(1) X = don't care

(2) Not available on the 64-pin RGC package.

(3) Direction controlled by eUSCI\_B1 module.

(4) Setting P6SEL1.x and P6SEL0.x disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals.

(5) Setting the CEPD.q bit of the comparator disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the C1.q input pin to the comparator multiplexer with the CEIPSEL or CEIMSEL bits automatically disables the output driver and input buffer for that pin, regardless of the state of the associated CEPD.q bit.

### 6.12.16 Port P6 (P6.6 and P6.7) Input/Output With Schmitt Trigger

Figure 6-12 shows the port diagram. Table 6-77 summarizes the selection of the pin functions.

**Figure 6-12. Py.x/Mod/USCI/Cp.q Pin Diagram**

**Table 6-77. Port P6 (P6.6 and P6.7) Pin Functions**

| PIN NAME (P6.x)                  | x | FUNCTION               | CONTROL BITS OR SIGNALS <sup>(1)</sup> |          |          |

(1) X = don't care

(2) Not available on the 64-pin RGC package.

(3) Setting P7SEL1.x and P7SEL0.x disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals.

(4) Setting the CEPD.q bit of the comparator disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the C0.q input pin to the comparator multiplexer with the CEIPSEL or CEIMSEL bits automatically disables the output driver and input buffer for that pin, regardless of the state of the associated CEPD.q bit.

### 6.12.20 Port PJ (PJ.0 and PJ.1) Input/Output With Schmitt Trigger

Figure 6-16 and Figure 6-17 show the port diagram. Table 6-81 summarizes the selection of the pin functions.

**Figure 6-16. Port PJ (PJ.0) Diagram**

|                 |   |                                    |                                        |                    |                    | X        | X        | 1 <sup>(3)</sup> |
|                 |   | LFXOUT crystal mode <sup>(2)</sup> | X                                      | X                  | X                  | 0        | 1        | 0                |

(1) X = don't care

(2) Setting PJSEL1.0 = 0 and PJSEL0.0 = 1 causes the general-purpose I/O to be disabled. When LFXTBYPASS = 0, PJ.0 and PJ.1 are configured for crystal operation and PJSEL1.1 and PJSEL0.1 are do not care. When LFXTBYPASS = 1, PJ.0 is configured for bypass operation and PJ.1 is configured as general-purpose I/O.

(3) When PJ.0 is configured in bypass mode, PJ.1 is configured as general-purpose I/O.

(4) With PJSEL0.1 = 1 or PJSEL1.1 = 1 the general-purpose I/O functionality is disabled. No input function is available. When configured as output, the pin is actively pulled to zero.

### 6.12.21 Port PJ (PJ.2 and PJ.3) Input/Output With Schmitt Trigger

Figure 6-18 and Figure 6-19 show the port diagrams. Table 6-82 summarizes the selection of the pin functions.

|                 |   |                                    |                                        |                    |                    | X        | X        | 1 <sup>(3)</sup> |
|                 |   | HFXOUT crystal mode <sup>(2)</sup> | X                                      | X                  | X                  | 0        | 1        | 0                |

(1) X = don't care

(2) Setting PJSEL1.3 = 0 and PJSEL0.3 = 1 causes the general-purpose I/O to be disabled. When HFXTBYPASS = 0, PJ.2 and PJ.3 are configured for crystal operation and PJSEL1.2 and PJSEL0.2 are do not care. When HFXTBYPASS = 1, PJ.3 is configured for bypass operation and PJ.2 is configured as general-purpose I/O.

(3) When PJ.3 is configured in bypass mode, PJ.2 is configured as general-purpose I/O.

(4) With PJSEL0.2 = 1 or PJSEL1.2 = 1 the general-purpose I/O functionality is disabled. No input function is available. When configured as output, the pin is actively pulled to zero.

### 6.12.22 Port PJ (PJ.4 and PJ.5) Input/Output With Schmitt Trigger

Table 6-83 summarizes the selection of the pin functions.

**Table 6-83. Port PJ (PJ.4 to PJ.5) Pin Functions**

| PIN NAME (PJ.x)             | x | FUNCTION   | CONTROL BITS OR SIGNALS <sup>(1)</sup> |          |          | SWJ MODE OF OPERATION <sup>(1)</sup> |
|-----------------------------|---|------------|----------------------------------------|----------|----------|--------------------------------------|
|                             |   |            | PJDIR.x                                | PJSEL1.x | PJSEL0.x |                                      |
| PJ.4/TDI <sup>(2)</sup>     | 4 | PJ.4 (I/O) | I: 0; O: 1                             | 0        | 0        | X                                    |
|                             |   | TDI        | X                                      | 0        | 1        | JTAG (4 wire)                        |
|                             |   | DVcc       |                                        |          |          | SWD (2 wire)                         |
|                             |   | DVcc       | X                                      | 1        | X        | X                                    |
| PJ.5/TDO/SWO <sup>(3)</sup> | 5 | PJ.5 (I/O) | I: 0; O: 1                             | 0        | 0        | X                                    |
|                             |   | TDO        | X                                      | 0        | 1        | JTAG (4 wire)                        |
|                             |   | SWO        |                                        |          |          | SWD (2 wire)                         |
|                             |   | Hi-Z       | X                                      | 1        | X        | X                                    |

(1) X indicates that the value of the control signal or mode of operation has no effect on the functionality.

(2) This pin is internally pulled up if PJSEL0.x is 1.

(3) When used in debug configuration, this pin must be pulled to ground through an external pulldown resistor.

### 6.12.23 Ports SWCLKTCK and SWDIOTMS With Schmitt Trigger

Table 6-84 summarizes the selection of the pin functions.

**Table 6-84. Ports SWCLKTCK and SWDIOTMS Pin Functions**

| PIN NAME                | FUNCTION      | SWJ MODE OF OPERATION |
|-------------------------|---------------|-----------------------|
| SWCLKTCK <sup>(1)</sup> | TCK (input)   | JTAG (4 wire)         |
|                         | SWCLK (input) | SWD (2 wire)          |
| SWDIOTMS <sup>(2)</sup> | TMS (input)   | JTAG (4 wire)         |
|                         | SWDIO (I/O)   | SWD (2 wire)          |

(1) This pin is internally pulled to DV<sub>SS</sub>.

(2) This pin is internal pulled to DV<sub>CC</sub>.

## 6.13 Device Descriptors (TLV)

[Table 6-85](#) summarizes the Device IDs of the MSP432P401x MCUs. [Table 6-86](#) lists the contents of the device descriptor tag-length-value (TLV) structure for the MSP432P401x MCUs.

**Table 6-85. Device IDs**

| DEVICE          | DEVICE ID |
|-----------------|-----------|
| MSP432P401RIPZ  | 0000A000h |
| MSP432P401MIPZ  | 0000A001h |
| MSP432P401RIZXH | 0000A002h |
| MSP432P401MIZXH | 0000A003h |
| MSP432P401RIRGC | 0000A004h |
| MSP432P401MIRGC | 0000A005h |

**Table 6-86. Device Descriptor Table<sup>(1)</sup>**

| DESCRIPTION |                             | ADDRESS   | VALUE                            |
|-------------|-----------------------------|-----------|----------------------------------|
|             | TLV checksum                | 00201000h | Per unit                         |

|                   | Reserved                                  | 0020114Ch-00201FFFh | FFFFFFFFh   |

(2) 128-Bit Random Number: The random number is generated during production test using the CryptGenRandom() function from Microsoft.

## 6.14 Identification

### 6.14.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see [Section 8.4](#).

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Hardware Revision entry in the Device Descriptor structure (see [Section 6.13](#)).

### 6.14.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see [Section 8.4](#).

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Device ID entry in the Device Descriptor structure (see [Section 6.13](#)).

### 6.14.3 Arm Cortex-M4F ROM Table Based Part Number

The MSP432P4xx family of MCUs incorporates a part number for the device for the IDEs to recognize the device, in addition to the device IDs specified in the device descriptors (TLV). This section describes how this information is organized on the device.

IEEE 1149.1 defines the use of a IDCODE register in the JTAG chain to provide the fields in [Table 6-87](#)

**Table 6-87. Structure of Device Identification Code**

| Bit Position | Field Description           |
|--------------|-----------------------------|
| 31-28        | Version                     |
| 27-12        | Part number of the device   |
| 11-1         | Manufacturer identity       |
| 0            | Reserved (always tied to 1) |

On MSP432P4xx MCUs, all these fields are implemented on the Arm Cortex-M4 ROM table. The part number can be read by the IDE tools (TI internal or third party) to determine the device. [Figure 6-20](#) shows the Peripheral ID register bit descriptions from the Arm Cortex-M4 specifications. See the *Arm Debug interface V5 Architecture Specification* for bit-level details on the Arm Cortex-M4 Peripheral ID registers.

**Figure 6-20. Arm Cortex-M4 Peripheral ID Register Description**

[Figure 6-20](#) shows that a one-to-one mapping is not possible for the following fields from [Table 6-87](#)

1. Version: IEEE 1149.1 defines a 4-bit field where as the Coresight compliant PID registers have 4 bits each for Revision (major revision) and RevAnd (minor revision)
2. Part Number: IEEE 1149.1 defines a 16-bit entity. However, the PID registers in the ROM table have only 12 bits reserved for this purpose (Part number – PID1 and PID0 registers).

For the MSP432P4xx MCUs, the Revision and RevAnd fields are used for tracking the major and minor revisions. Also the Customer modified (4-bit) field is used for extending the Part number to 16 bits, to accommodate all of the fields needed by IEEE 1149.1 in the ROM table.

As an example, the ROM table with IEEE 1149.1-complaint device IDCODE for the MSP432P401xx MCU is 0000-1011-1001-1010-1111-0000-0010-1111 (see [Figure 6-21](#)).

**Figure 6-21. Example of ROM PID Entries for MSP432P401xx MCU**

## 7 Applications, Implementation, and Layout

### NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Device Connection and Layout Fundamentals

This section discusses the recommended guidelines when designing with the MSP432 microcontrollers. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

#### 7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 4.7- $\mu$ F plus a 100-nF low-ESR ceramic decoupling capacitor to each AVCC and DVCC pin (see [Figure 7-1](#)). Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital-to-analog circuits on the board and for high analog accuracy.

Figure 7-1. Power Supply Decoupling

#### 7.1.2 External Oscillator

The device supports a low-frequency crystal (32.768 kHz) on the LFXT pins and a high-frequency crystal on the HFXT pins. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the LFXIN and HFXIN input pins that meet the specifications of the respective oscillator if the appropriate LFXTBYPASS or HFXTBYPASS mode is selected. In this case, the associated LFXOUT and HFXOUT pins can be used for other purposes.

[Figure 7-2](#) shows a typical connection diagram.

Figure 7-2. Typical Crystal Connection

See [MSP430 32-kHz Crystal Oscillators](#) for more information on selecting, testing, and designing a crystal oscillator with the MSP432 devices.

### 7.1.3 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See [MSP430 32-kHz Crystal Oscillators](#) for recommended layout guidelines.
- Proper bypass capacitors on DVCC, AVCC, and reference pins if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See [MSP430 System-Level ESD Considerations](#) for guidelines.

### 7.1.4 Do's and Don'ts

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in *Absolute Maximum Ratings*. Exceeding the specified limits may cause malfunction of the device.

## 7.2 Peripheral and Interface-Specific Design Information

### 7.2.1 Precision ADC Peripheral

#### 7.2.1.1 Partial Schematic

Figure 7-3 shows a partial schematic of the Precision ADC external connections.

**Figure 7-3. Precision ADC Grounding and Noise Considerations**

#### 7.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate PCB layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in [Section 7.1.1](#) combined with the connections shown in [Section 7.2.1.1](#) prevent this.

In addition to grounding, ripple and noise spikes on the power-supply lines that are caused by digital switching or switching power supplies can corrupt the conversion result. A noise-free design using separate analog and digital ground planes with a single-point connection is recommended to achieve high accuracy.

Figure 7-3 shows the recommended decoupling circuit when an external voltage reference is used.

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage enters the device. In this case, the 5- $\mu$ F capacitor is used to buffer the reference pin and filter any low-frequency ripple. A 50-nF bypass capacitor is used to filter out any high-frequency noise.

### 7.2.1.3 Layout Guidelines

Components that are shown in the partial schematic (see [Figure 7-3](#)) should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

If differential mode is used for the Precision ADC, the analog differential input signals must be routed close together to minimize the effect of noise on the resulting signal.

## 8 Device and Documentation Support

### 8.1 Getting Started and Next Steps

For more information on the MSP432 family of microcontrollers and the tools and libraries that are available to help with your development, visit [SimpleLink™ Arm® MSP432 microcontrollers](#).

### 8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

**MSP** – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 8-1](#) shows a legend for reading the complete device name.

**Figure 8-1. Device Nomenclature**

### 8.3 Tools and Software

All MSP432 microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [SimpleLink™ Arm® MSP432 microcontrollers](#).

Table 8-1 lists the supported debug features. See the [Code Composer Studio™ IDE for SimpleLink™ MSP432™ Microcontrollers User's Guide](#) for details on the available hardware features. See [Advanced Debugging Using the Enhanced Emulation Module \(EEM\) With Code Composer Studio IDE](#) and [MSP Advanced Power Optimizations: ULP Advisor™ and EnergyTrace™ Technology](#) for further usage information.

**Table 8-1. Hardware Debug Features**

| FAMILY     | JTAG | SWD | NUMBER OF<br>BREAKPOINTS | ITM | DWT | FPB |
|------------|------|-----|--------------------------|-----|-----|-----|
| MSP432P4xx | Yes  | Yes | 6                        | Yes | Yes | Yes |

EnergyTrace technology is supported with Code Composer Studio version 6.0 and newer. It requires specialized debugger circuitry, which is supported on MSP432 LaunchPad development kits, XDS110 stand-alone debug probe, and second-generation stand-alone MSP-FET JTAG emulator. See the following documents for more detailed information.

[MSP Advanced Power Optimizations: ULP Advisor™ and EnergyTrace™ Technology](#)

[Code Composer Studio™ IDE for SimpleLink™ MSP432™ Microcontrollers User's Guide](#)

[MSP432™ SimpleLink™ Microcontrollers Hardware Tools User's Guide](#)

## Design Kits and Evaluation Modules

**MSP432P401R LaunchPad Development Kit** The MSP432P401R LaunchPad development kit enables you to develop high-performance applications that benefit from low-power operation. The kit features the MSP432P401R MCU, which includes a 48-MHz Arm Cortex-M4F, 80-μA/MHz active power, and 660-nA standby with RTC operation, a 14-bit 1-Msps differential SAR ADC with up to 16-bit ENOB, and an AES256 accelerator.

**100-Pin Target Development Board for MSP432P4x MCUs** The MSP-TS432PZ100 is a stand-alone ZIF socket target board used to program and debug the MSP432 in-system through the JTAG interface or the Serial Wire Debug (SWD 2-wire JTAG) protocol. The development board supports all MSP432P4xx flash parts in a 100-pin LQFP package (TI package code: PZ).

## Software

**SimpleLink MSP432 Software Development Kit (SDK)** The SimpleLink MSP432 SDK is a comprehensive software package that enables engineers to quickly develop highly functional applications on MSP432 MCUs. The SDK comprises multiple compatible software components including RTOS, drivers, middleware, and examples of how to use these components together. Examples demonstrate each functional area and each supported device and can be a starting point for your own projects. The SimpleLink MSP432 SDK is part of TI's SimpleLink platform allowing 100 percent code reuse between SimpleLink MCUs.

**RTOS for MSP432 Microcontrollers** MSP432 MCUs offer compatibility with several TI and third party Real-Time Operating Systems (RTOS). Visit this link to learn about the key features of each to suit your design needs.

## Development Tools

**Code Composer Studio Integrated Development Environment for MSP Microcontrollers** Code Composer Studio is an integrated development environment (IDE) that supports all MSP microcontroller devices. Code Composer Studio comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. For more information, see the [Code Composer Studio™ IDE 7.1+ for SimpleLink™ MSP432™ Microcontrollers User's Guide](#).

**Arm® Keil® MDK – Free 32KB IDE** The Arm Keil MDK is a complete debugger and C/C++ compiler toolchain for building and debugging embedded applications. Keil MDK supports the low-power and high-performance MSP432 MCU family, and includes a fully integrated debugger for source and disassembly level debugging with support for complex code and data breakpoint. For more information, see the [Arm® Keil® MDK Version 5 for SimpleLink™ MSP432™ Microcontrollers User's Guide](#).

**IAR Embedded Workbench® Kickstart** IAR Embedded Workbench Kickstart for MSP is a complete debugger and C/C++ compiler toolchain for building and debugging embedded applications based on MSP430 and MSP432 microcontrollers. The code size limitation of C/C++ compiler is set to 32KB for MSP432 devices. For more information, see the [IAR Embedded Workbench® for Arm® 7.x for SimpleLink™ MSP432™ Microcontrollers User's Guide](#).

**MSP432P4xx CMSIS Device Family Pack** TI provides a CMSIS-compliant device family pack for MSP432P4xx devices. This pack adds MSP432P4xx device support to IAR EWARM 8.x, Keil MDK 5.x, and Atollic TrueSTUDIO® 7.x. In IAR EWARM this pack is optional as the IDE supports the devices natively.

**Debuggers for MSP432 Microcontrollers** MSP432 MCUs are designed to work with a variety of debuggers from Texas Instruments and third-party vendors.

**MSP EnergyTrace Technology** EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the application's energy profile and helps to optimize it for ultra-low-power consumption.

**MSP MCU Programmer and Debugger** The MSP-FET is a powerful emulation development tool – often called a debug probe – that allows users to quickly begin application development on MSP low-power microcontrollers.

**MSP-GANG Production Programmer** The MSP Gang Programmer is an MSP430 and MSP432 device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process.

**Pin Mux Tool** The Pin Mux Utility is a software tool that provides a graphical user interface for configuring pin multiplexing settings, resolving conflicts, and specifying I/O cell characteristics for TI MPUs. Results are output as C header and code files that can be imported into software development kits or used to configure customer's custom software. Version 3 of the Pin Mux utility can automatically selecting a mux configuration that satisfies the requirements entered by the user.

**ULP (Ultra-Low Power) Advisor** ULP (Ultra-Low Power) Advisor is a tool for guiding developers to write more efficient code to fully utilize the unique ultra-low power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to squeeze every last nano amp out of your application.

## 8.4 Documentation Support

The following documents describe the MSP430P401x MCUs. Copies of these documents are available on the [TI website](http://ti.com).

### Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on [ti.com](http://ti.com) (see [Section 8.5](#) for links to product folders). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

### Errata

**MSP432P401R Device Erratasheet** Describes the known exceptions to the functional specifications for each silicon revision of this device.

**MSP432P401M Device Erratasheet** Describes the known exceptions to the functional specifications for each silicon revision of this device.

### User's Guides

**MSP432P4xx SimpleLink™ Microcontrollers Technical Reference Manual** Detailed description of all modules and peripherals available in this device family.

**Code Composer Studio™ IDE 7.1+ for SimpleLink™ MSP432™ Microcontrollers User's Guide** This manual describes the use of the TI Code Composer Studio IDE (CCS) version 7.1 and later with the MSP432 low-power microcontrollers.

**IAR Embedded Workbench for Arm 7.x for SimpleLink™ MSP432™ Microcontrollers User's Guide** This manual describes the use of IAR Embedded Workbench for Arm (EWARM) version 7.x with the MSP432 low-power microcontrollers.

**Arm® Keil® MDK Version 5 for SimpleLink™ MSP432™ Microcontrollers User's Guide** This user's guide describes the use of the Arm Keil MDK version 5 with the MSP432 low-power microcontrollers.

**GCC Arm® Embedded Toolchain for SimpleLink™ MSP432™ Microcontrollers User's Guide** This manual describes the setup and basic operation of the MSP432 programming and debug using GCC Arm compiler and the GDB debugger.

**MSP432™ SimpleLink™ Microcontrollers Bootloader (BSL) User's Guide** The MSP432 BSL enables users to communicate with embedded memory in the MSP432 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required.

**MSP432 Capacitive Touch Software Library Programmer's Guide** MSP432 microcontrollers are equipped with the peripherals needed to perform a capacitance measurement. The purpose of the capacitive touch software library is to create a single interface that can be integrated with the peripheral set found in MSP432 devices. This document explains the capacitive touch library configuration and use with MSP432 devices.

## Application Reports

**Platform Migration to SimpleLink™ MSP432™ Microcontrollers** The goals for this migration guide are to help developers accurately assess the effort to port an existing application from one MSP platform to another, and ultimately to derive a porting strategy with complete hardware and software coverage that properly ports the existing application without introducing bugs due to platform differences yet that takes advantages of the unique features or performance improvements in the new platform.

### Designing an Ultra-Low-Power (ULP) Application With SimpleLink™ MSP432™ Microcontrollers

With the growing system complexity in ultra-low-power microcontroller applications, minimizing the overall energy consumption is one of the most difficult problems to solve. Multiple aspects including silicon, other onboard hardware components, and application software must be considered. There are some obvious generic techniques that can be used to reduce energy consumption such as reducing operating voltage or frequency. Many of these generic techniques may not greatly reduce energy consumption independently, but taken as a whole, the results can be significant, as there are many interdependencies across these components.

**Maximizing MSP432P4xx Voltage Regulator Efficiency** This application report describes the relationship of the DC-DC and LDO voltage regulators on the MSP432P4xx MCU, provides guidelines on choosing which is most efficient for your application, and gives board layout considerations for the DC-DC.

**Leveraging Low-Frequency Power Modes on SimpleLink™ MSP432P4xx Microcontrollers** Low power consumption is very important in all battery powered embedded applications. But the operating frequency of these embedded applications can be diverse based the needs of the application. Some applications might require operating at higher frequencies, in the order of several megahertz, while some other applications might require operating at lower frequencies, in the order of a few tens or a few hundreds of kilohertz. There are several microcontrollers in the market that offer good active mode power consumption when the operating frequency is in the order of several megahertz. But it is a challenge to get the power consumption low when the operating frequency is in the order of kilohertz. The low-frequency power modes available on the MSP432P4xx microcontrollers offer very low power consumption when low frequency of operation is used by the target application.

**Software IP Protection on MSP432P4xx Microcontrollers** Differentiations in embedded software applications enable differentiated products. Companies invest significant money in building differentiated software application. Hence, protecting this investment (application or portions of the application) is extremely important. This application note describes how to protect software intellectual property (IP) running on the Texas Instruments MSP432P401x family of microcontrollers.

## 8.5 Related Links

Table 8-2 lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 8-2. Related Links**

## 8.6 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### [TI E2E™ Community](#)

*TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At [e2e.ti.com](#), you can ask questions, share knowledge, explore ideas, and help solve problems with fellow engineers.

### [TI Embedded Processors Wiki](#)

*Texas Instruments Embedded Processors Wiki.* Established to help developers get started with embedded processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

## 8.7 Trademarks

MSP432, LaunchPad, SimpleLink, ULP Advisor, EnergyTrace, E2E are trademarks of Texas Instruments. Arm, Cortex, Thumb, Keil are registered trademarks of Arm Limited.

TrueSTUDIO is a registered trademark of Atollic.

*Bluetooth* is a registered trademark of Bluetooth SIG.

ULPBench, ULPMark are trademarks of EEMBC.

Wi-Fi is a registered trademark of Wi-Fi Alliance.

## 8.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 8.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

## 8.10 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

# MECHANICAL DATA

MTQF013A – OCTOBER 1994 – REVISED DECEMBER 1996

PZ (S-PQFP-G100)

PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Falls within JEDEC MS-026

## LAND PATTERN DATA

PZ (S–PQFP–G100)

PLASTIC QUAD FLAT PACK

### NOTES:

- All linear dimensions are in millimeters.
- This drawing is subject to change without notice.
- Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
- Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

**RGC0064B**

## PACKAGE OUTLINE

**VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

## EXAMPLE BOARD LAYOUT

**RGC0064B**

**VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

## EXAMPLE STENCIL DESIGN

**RGC0064B**

**VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

**ZXH0080A**

## PACKAGE OUTLINE

**NFBGA - 1 mm max height**

BALL GRID ARRAY

### NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis is for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This is a Pb-free solder ball design.

**EXAMPLE BOARD LAYOUT****ZXH0080A****NFBGA - 1 mm max height**

BALL GRID ARRAY

**LAND PATTERN EXAMPLE**  
SCALE:15X

**SOLDER MASK DETAILS**  
NOT TO SCALE

4221325/A 01/2014

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints.  
See Texas Instruments Literature No. SBVA017 ([www.ti.com/lit/sbva017](http://www.ti.com/lit/sbva017)).

## EXAMPLE STENCIL DESIGN

**ZXH0080A**

**NFBGA - 1 mm max height**

BALL GRID ARRAY

**SOLDER PASTE EXAMPLE**  
 BASED ON 0.1 mm THICK STENCIL  
 SCALE:20X

4221325/A 01/2014

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

## PACKAGING INFORMATION

| Orderable Device | Status<br>(1) | Package Type | Package<br>Drawing | Pins | Package<br>Qty | Eco Plan<br>(2)            | Lead/Ball Finish<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples                 |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

---

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale ([www.ti.com/legal/termsofsale.html](http://www.ti.com/legal/termsofsale.html)) or other applicable terms available either on [ti.com](http://ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.
