

## FEATURES

- Digital Selection of 0V,  $V_{CC}$ , 12V or Hi-Z
- Output Current Capability: 120mA
- Internal Current Limiting and Thermal Shutdown
- Automatic Switching from 3.3V to 5V
- Powered from Unregulated 13V to 20V Supply
- Logic Compatible with Standard PCMCIA Controllers
- Output Capacitors: 1 $\mu$ F
- Quiescent Current in Hi-Z or 0V Mode: 60 $\mu$ A
- Independent VPP Valid Status Feedback Signals
- No VPP Overshoot

## APPLICATIONS

- Notebook Computers
- Palmtop Computers
- Pen-Based Computers
- Handi-Terminals
- Bar-Code Readers
- Flash Memory Programming

## DESCRIPTION

The LT<sup>®</sup>1313 is a member of Linear Technology Corporation's PCMCIA driver/regulator family. It provides 0V, 3.3V, 5V, 12V and Hi-Z regulated power to the VPP pins of two PCMCIA card slots from a single unregulated 13V to 20V supply. When used in conjunction with a PC Card Interface Controller, the LT1313 forms a complete minimum component-count interface for palmtop, pen-based and notebook computers. The two VPP output voltages are independently selected by four logic compatible digital inputs which interface directly with industry standard PC Card Interface Controllers.

Automatic 3.3V to 5V switching is provided by two independent comparators which continuously monitor each PC card  $V_{CC}$  supply voltage and automatically adjust the VPP output to match the associated  $V_{CC}$  pin voltage when the VPP =  $V_{CC}$  mode is selected.

Two open-collector VPP  $\overline{\text{VALID}}$  outputs are provided to indicate when the VPP outputs are in regulation at 12V.

The LT1313 is available in 16-pin SO packaging.

 LTC and LT are registered trademarks of Linear Technology Corporation.

## OPERATION

The LT1313 is two programmable output voltage, low-dropout linear regulators designed specifically for PCMCIA VPP drive applications. Input power is typically obtained from a loosely regulated input supply between 13V and 20V. The LT1313 consists of the following blocks:

**Two Low Dropout Voltage Linear Regulators:** The heart of the LT1313 is two PNP-based low-dropout voltage regulators which drop the unregulated supply voltage from 13V to 20V down to 12V, 5V, 3.3V, 0V or Hi-Z depending upon the state of the four Enable inputs and the two  $V_{CC}$  Sense inputs. The regulators have built-in current limiting and thermal shutdown to protect the device, the loads, and the sockets against inadvertent short circuiting to ground.

**Voltage Control Logic:** The two  $VPP_{OUT}$  outputs have five possible output modes: 0V, 3.3V, 5V, 12V and Hi-Z. These five modes are selected by the four Enable inputs and the two  $V_{CC}$  Sense inputs as described by the Truth Table.

**$V_{CC}$  Sense Comparators:** When the  $V_{CC}$  mode is selected, the LT1313 automatically adjusts each regulated VPP output voltage to 3.3V or 5V depending upon the voltage present

at the corresponding PC card  $V_{CC}$  supply pin. The threshold voltage for these comparators is set at 4V and there is approximately 50mV of hysteresis provided to ensure clean switching between 3.3V and 5V.

**VPP VALID Comparator:** Two voltage comparators monitor each output voltage when the 12V mode is selected and are driven low when the output is in regulation above 11V. These two outputs function separately.

Note: Each channel is independently controlled.

## APPLICATIONS INFORMATION

The LT1313 is two voltage programmable linear regulators designed specifically for PCMCIA VPP driver applications. The device operates with very low quiescent current (60μA) in the 0V and Hi-Z modes of operation. In the Hi-Z mode, the output leakage current falls to 1μA. In addition to the low quiescent currents, the LT1313 incorporates several protection features which make it ideal for PCMCIA applications. The LT1313 has built-in current limiting (330mA) and thermal shutdown to protect the device and the socket VPP pins against inadvertent short-circuit conditions.

### Output Capacitance

The LT1313 is designed to be stable with a wide range of output capacitors. The minimum recommended value is a 1μF with an ESR of 3Ω or less. The capacitor is connected directly between the output pin and ground. For applications where space is very limited, capacitors as low as 0.33μF can

be used. Extremely low ESR ceramic capacitors with values less than 1μF must have a 2Ω resistor added in series with the output capacitor.

### Transient and Switching Performance

The LT1313 is designed to produce minimal overshoot with capacitors in the range of 1μF to 10μF. Larger capacitor values can be used with a slowing of rise and fall times.

The positive output slew rate is determined by the 330mA current limit and the output capacitor. The rise time for a 0V to 12V transition is approximately 40μs and the rise time for a 10μF capacitor is roughly 400μs (see the Transient Response curves in the Typical Performance Characteristics section).

## APPLICATIONS INFORMATION

The fall time from 12V to 0V is set by the output capacitor and an internal pull-down current source which sinks about 30mA. This source will fully discharge a 1μF capacitor in less than 1ms.

### Thermal Considerations

Power dissipated by the device is the sum of two components: output current multiplied by the input-output differential voltage:  $I_{OUT} \times (V_{IN} - V_{OUT})$ , and ground pin current multiplied by supply voltage:  $(I_{GND} \times V_{IN})$ .

The ground pin current can be found by examining the Ground Pin Current curves in the Typical Performance Characteristics section.

Heat sinking, for surface mounted devices, is accomplished by using the heat spreading capabilities of the PC board and its copper traces.

The junction temperature of the LT1313 must be limited to 125°C to ensure proper operation. Use Table 1, in conjunction with the typical performance graphs, to calculate the power dissipation and die temperature for a particular application and ensure that the die temperature does not exceed 125°C under any operating conditions.

**Table 1. 16-Pin SO Package\***

| COPPER AREA |            | BOARD AREA | THERMAL RESISTANCE<br>(JUNCTION-TO-AMBIENT) |
|-------------|------------|------------|---------------------------------------------|
| TOPSIDE     | BACKSIDE   |            |                                             |
| 2500 sq mm  | 2500 sq mm | 2500 sq mm | 120°C/W                                     |
| 1000 sq mm  | 2500 sq mm | 2500 sq mm | 120°C/W                                     |
| 225 sq mm   | 2500 sq mm | 2500 sq mm | 125°C/W                                     |
| 1000 sq mm  | 1000 sq mm | 1000 sq mm | 131°C/W                                     |

\* Device is mounted on topside.

### Calculating Junction Temperature

Example: given an output voltage of 12V, an input supply voltage of 14V, and an output current of 100mA (one VPP output), and a maximum ambient temperature of 50°C, what will the maximum junction temperature be?

Power dissipated by the device will be equal to:

$$I_{OUT} \times (V_S - V_{PP_{OUT}}) + (I_{GND} \times V_{IN})$$

where,

$$I_{OUT} = 100\text{mA}$$

$$V_{IN} = 14\text{V}$$

$$I_{GND} \text{ at } (I_{OUT} = 100\text{mA}, V_{IN} = 14\text{V}) = 5\text{mA}$$

so,

$$P_D = 100\text{mA} \times (14\text{V} - 12\text{V}) + (5\text{mA} \times 15\text{V}) = 0.275\text{W}$$

Using Table 1, the thermal resistance will be in the range of 120°C/W to 131°C/W depending upon the copper area. So the junction temperature rise above ambient will be less than or equal to:

$$0.275\text{W} \times 131^\circ\text{C/W} = 36^\circ\text{C}$$

The maximum junction temperature will then be equal to the junction temperature rise above ambient plus the maximum ambient temperature or:

$$T_{JMAX} = 50^\circ\text{C} + 36^\circ\text{C} = 86^\circ\text{C}$$

*For more detailed applications information, see the LT1312 Single PCMCIA VPP Driver/Regulator data sheet.*
