

## Galvanic isolated octal high-side smart power solid state-relay

**PowerSO-36**

### Features

Type	$V_{\text{demag}}^{(1)}$	$R_{DS(\text{on})}^{(1)}$	$I_{\text{OUT}}^{(1)}$	$V_{\text{cc}}$
ISO8200B	$V_{\text{cc}} - 45 \text{ V}$	$0.12 \Omega$	$0.7 \text{ A}$	$45 \text{ V}$

1. *Per channel.*
  - Parallel input interface
  - Direct and synchronous control mode
  - High common mode transient immunity
  - Output current: 0.7 A per channel
  - Short-circuit protection
  - Channel overtemperature protection
  - Thermal independence of separate channels
  - Common output disable pin
  - Case overtemperature protection
  - Loss of  $GND_{\text{cc}}$  and  $V_{\text{cc}}$  protection
  - Undervoltage shutdown with auto-restart and hysteresis
  - Overvoltage protection ( $V_{\text{cc}}$  clamping)
  - Very low supply current
  - Common fault open-drain output
  - 5 V and 3.3 V TTL/CMOS compatible I/Os
  - Fast demagnetization of inductive loads
  - Reset function for IC output disable
  - ESD protection
  - IEC 61000-4-2, IEC 61000-4-4, IEC 61000-4-5 and IEC 61000-4-8 compliant
  - UL1577 certification

 <b>SUSTAINABLE TECHNOLOGY</b>		

### Applications

- Programmable logic control
- Industrial PC peripheral input/output
- Numerical control machines
- Drivers for all types of loads (resistive, capacitive, inductive)

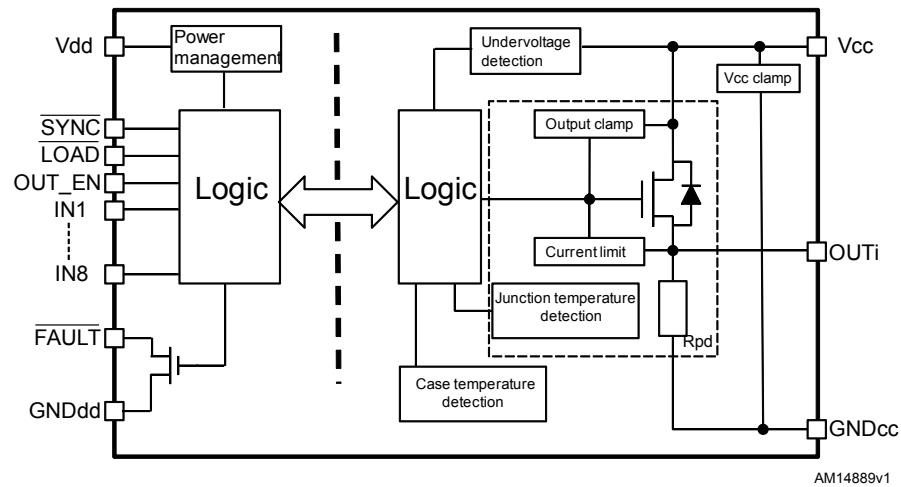

### Description

The ISO8200B is a galvanic isolated 8-channel driver featuring a very low supply current. It contains 2 independent galvanic isolated voltage domains ( $V_{\text{cc}}$  for the power stage and  $V_{\text{dd}}$  for the digital stage). Additional embedded functions are: loss of GND protection, undervoltage shutdown with hysteresis, and reset function for immediate power output shutdown.

IC is intended to drive any kind of load with one side connected to ground. Active channel current limitation combined with thermal shutdown, (independent for each channel), and automatic restart, protect the device against overload and short-circuit. In overload conditions, if junction temperature overtakes threshold, the channel involved is turned off and on again automatically after the IC temperature decreases below a reset threshold. If this condition causes case temperature to reach TCR limit threshold, the overloaded channel is turned off and it only restarts when case and junction temperature decrease down to the reset thresholds. Non-overloaded channels continue operating normally. An internal circuit provides an OR-wired non-latched common FAULT indicator signaling the channel OVT. The FAULT pin is an open-drain active low fault indication pin.

## 6 Functional description

### 6.1 Parallel interface

Smart parallel interface built-in ISO8200B offers three interfacing signals easily managed by a microcontroller. The LOAD signal enables the input buffer storing the value of the channel inputs.

The SYNC signal copies the input buffer value into the transmission buffer and manages the synchronization between low voltage side and the channel outputs on the isolated side.

The OUT\_EN signal enables the channel outputs.

An internal refresh signal updates the configuration of the channel outputs with a  $f_{refresh}$  frequency. This signal can be disabled forcing low the SYNC input when LOAD is high.

SYNC and LOAD pins can operate in direct control mode (DCM) or synchronous control mode (SCM).

The operation of these two signals is described as follows:

**Table 12. Interface signal operation (general)**

<u>LOAD</u>	<u>SYNC</u>	<u>OUT_EN</u>	Device behavior
Don't care	Don't care	Low <sup>(1)</sup>	The outputs are disabled (turned off)
High	High	High	The outputs are left unchanged
Low	High	High	The input buffer is enabled The outputs are left unchanged
High	Low	High	The internal refresh signal is disabled The transmission buffer is updated The outputs are left unchanged
Low	Low	High	The device operates in direct control mode as described in the respective paragraph

1. *The outputs are turned off on OUT\_EN falling edge and they are kept disabled as long as it is low.*

#### 6.1.1 Input signals (IN1 to IN8)

Inputs from IN1 to IN8 are the driving signals of the corresponding OUT1 to OUT8 outputs. Data are direct loaded on related outputs if SYNC and LOAD inputs are low (DCM operation) or stored into input buffer when LOAD is low and SYNC is high.

#### 6.1.2 Load input data (LOAD)

The input is active low; it stores the data from IN1 to IN8 into the input buffer.

#### 6.1.3 Output synchronization (SYNC)

The input is active low; it enables the ISO8200B transmission buffer loading input buffer data and manages the transmission between the two isolated sides of the device.

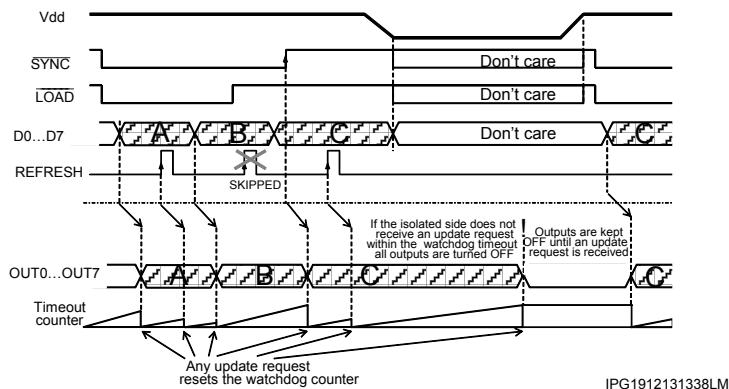

#### 6.1.4 Watchdog

The isolated side of the device provides a watchdog function in order to guarantee a safe condition when  $V_{dd}$  supply voltage is missing.

If the logic side does not update the output status within  $t_{WD}$ , all outputs are disabled until a new update request is received.

The refresh signal is also considered a valid update signal, so the isolated side watchdog does not protect the system from a failure of the host controller (MCU freezing).

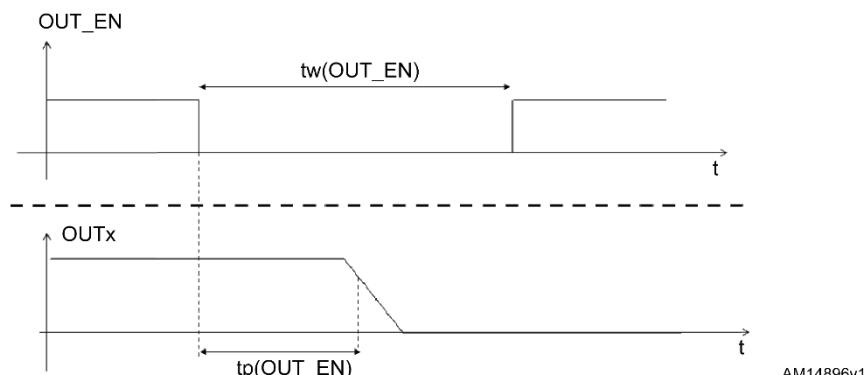

Figure 7. Watchdog behavior

### 6.1.5 Output enable (OUT\_EN)

This pin provides a fast way to disable all outputs simultaneously. When the OUT\_EN pin is driven low the outputs are disabled. To enable the output stage, the OUT\_EN pin has to be raised. This timing execution is compatible with an external reset push, safety requirement, and allows, in a PLC system, the microcontroller polling to obtain all internal information during a reset procedure.

Figure 8. Output channel enable timing

## 6.2 Direct control mode (DCM)

When SYNC and LOAD inputs are driven by the same signal, the device operates in direct control mode (DCM).

In DCM the SYNC / LOAD signal operates as an active low input enable:

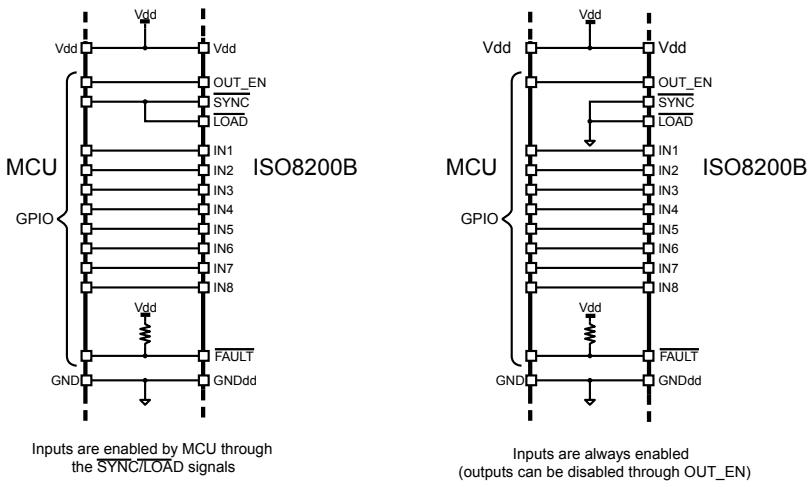

- when the signal is high, the current output configuration is kept regardless the input values
- when the signal is low, each channel input directly drives the respective output

This operation mode can also be set shorting both signals to the digital ground; in this case the channel outputs are always directly driven by the inputs except when OUT\_EN is low (outputs disabled).

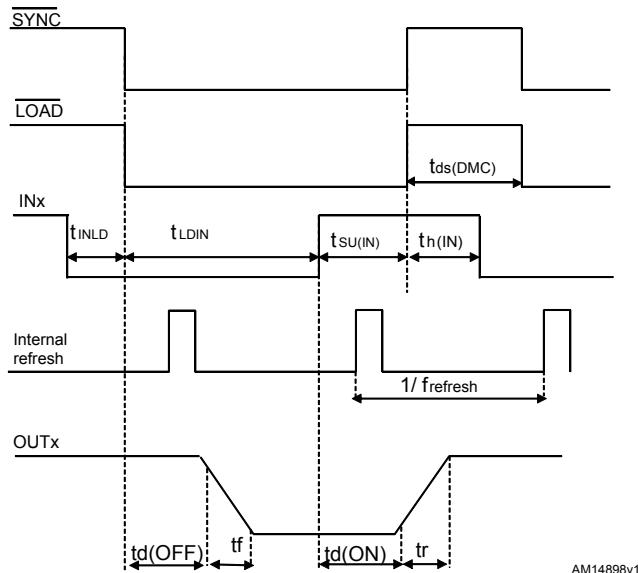

Table 13. Interface signal operation in direct control mode

SYNC / LOAD	OUT_EN	Device behavior
Don't care	Low <sup>(1)</sup>	The outputs are disabled (turned off)
High	High	The outputs are left unchanged
Low	High	The channel inputs drive the outputs

1. The outputs are turned off on OUT\_EN falling edge and they are kept disabled as long as it is low.

**Figure 9.** Direct control mode IC configuration

AM14897v1

**Figure 10.** Direct control mode time diagram

AM14898v1

### 6.3

### Synchronous control mode (SCM)

When SYNC and LOAD inputs are independently driven, the device can operate in synchronous control mode (SCM). The SCM is used to reduce the jittering of the outputs and to drive all outputs of different devices at the same time.

In SCM the LOAD signal is forced low to update the input buffer while the SYNC signal is high. The LOAD signal is raised and the SYNC one is forced low for at least  $t_{SYNC(SCM)}$ . During this period, the internal refresh is disabled and any pending transmission between the low voltage and the isolated side is completed. When the SYNC signal is raised the channel output configuration is changed according to the one stored in the input.

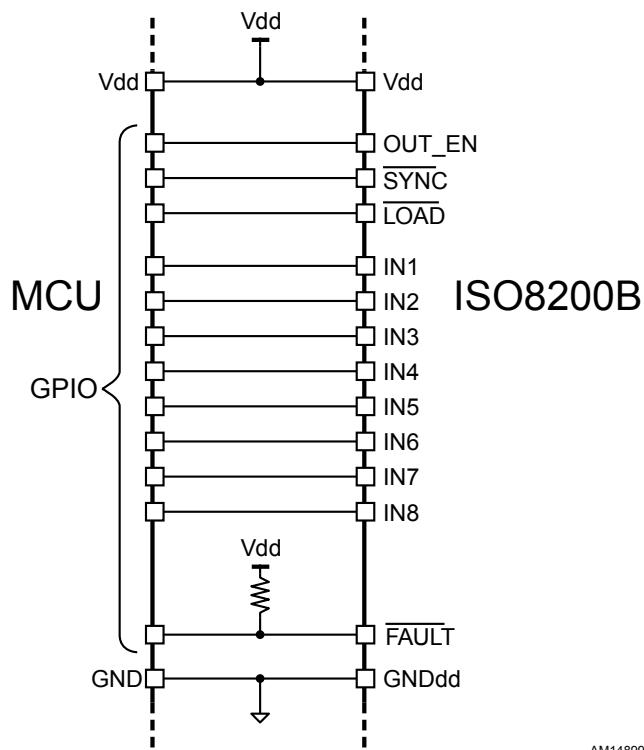

If the  $t_{SYNC(SCM)}$  limit is met, the maximum jitter of the channel outputs is  $t_{jitter(SCM)}$ .

If more devices share the same SYNC signal, all device outputs change simultaneously with a maximum jitter related to maximum delay and maximum jitter for single device.

**Table 14.** Interface signal operation in synchronous control mode

LOAD	SYNC	OUT_EN	Device behavior
Don't care	Don't care	Low <sup>(1)</sup>	The outputs are disabled (turned off)
High	High	High	The outputs are left unchanged
Low	High	High	The input buffer is enabled The outputs are left unchanged
High	Low	High	The internal refresh signal is disabled The transmission buffer is updated The outputs are left unchanged
High	Rising edge	High	The outputs are updated according to the current transmission buffer value
Low	Low	High	Should be avoided (DCM operation only)

1. The outputs are turned off on OUT\_EN falling edge and they are kept disabled as long as it is low.

**Figure 11.** Synchronous control mode IC configuration

AM14899v1

Figure 12. Synchronous control mode time diagram

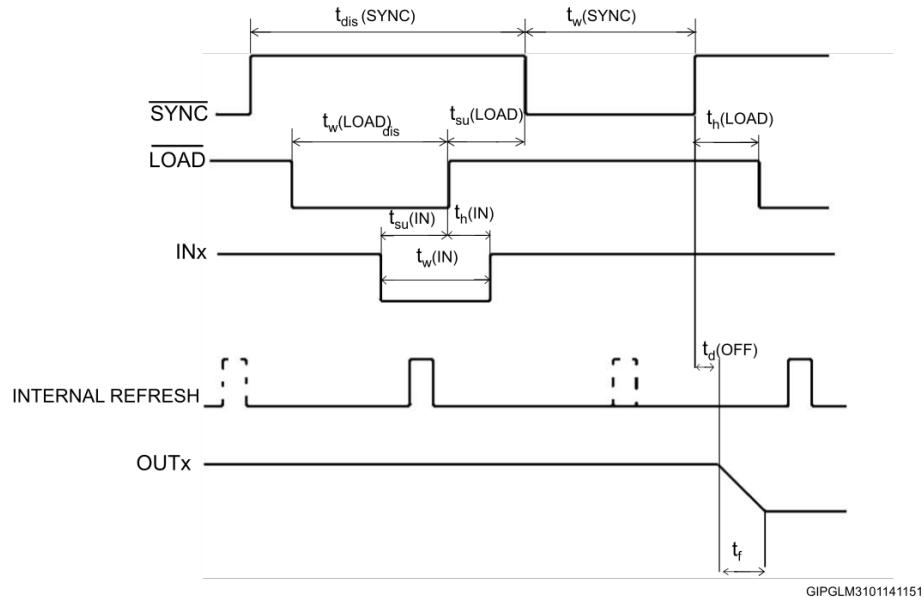

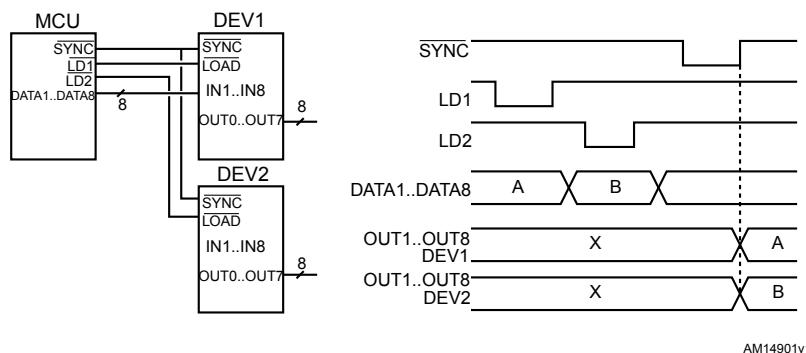

Figure 13. Multiple device synchronous control mode

## 6.4 Fault indication

The FAULT pin is an active low open-drain output indicating fault conditions. This pin is active when at least one of the following conditions occurs:

- Junction overtemperature of one or more channels ( $T_J > T_{TJSD}$ )
- Communication error

The communication error is intended as an internal data corruption event in the data transfer through isolation. In case of communication error the outputs are initially kept in the previous status and then reset (turned off) at the first communication error during data transfer of the refresh signal.

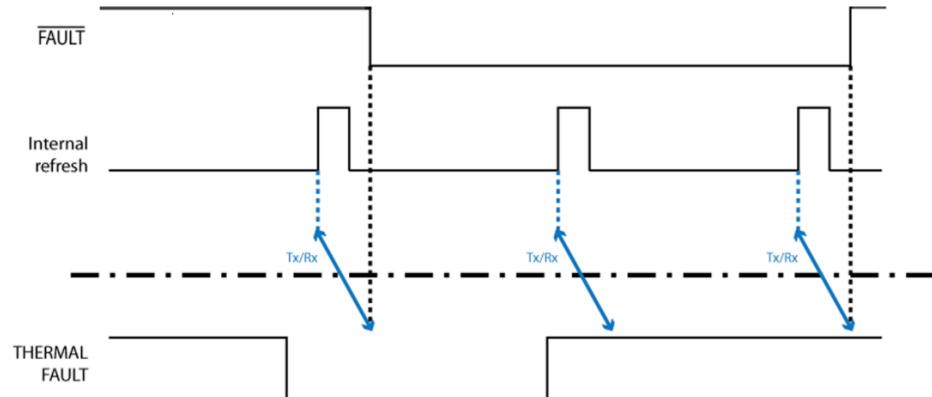

### 6.4.1 Junction overtemperature and case overtemperature

The thermal status of the device is updated during each transmission sequence between the two isolated sides.

In SCM operation, when the LOAD signal is high and the SYNC one is low, the communication is disabled. In this case the thermal status of the device cannot be updated and the FAULT indication can be different from the current status.

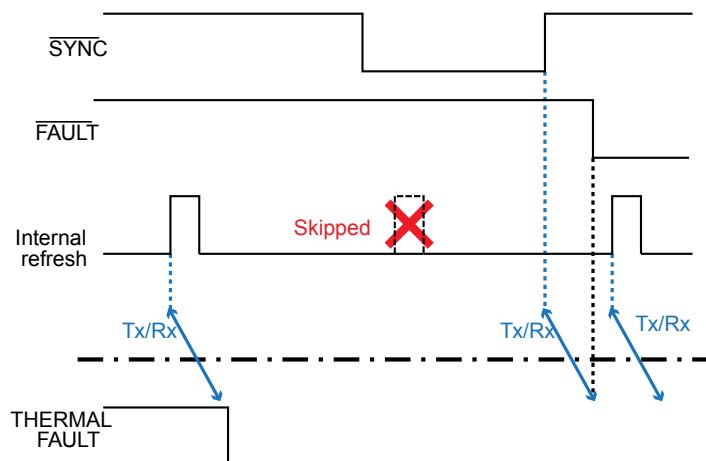

In any case, the thermal protection of the channel outputs is always operative.

Figure 14. Thermal status update (DCM)

AM14902v1

Figure 15. Thermal status update (SCM)

AM14992v1

## 7

## Power section

## 7.1

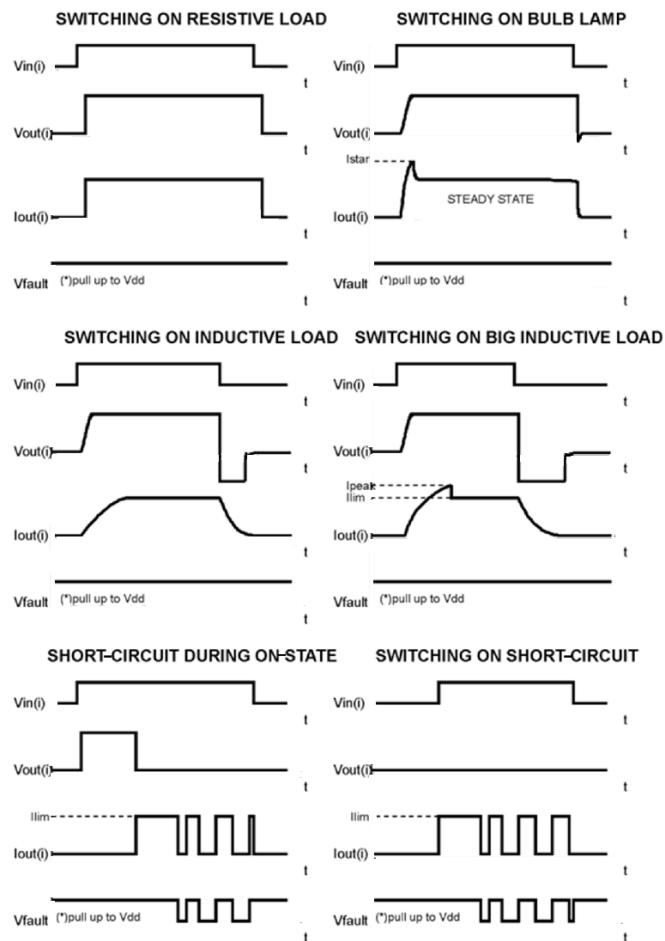

## Current limitation

The current limitation process is active when the current sense connected on the output stage measures a current value, which is higher than a fixed threshold.

When this condition is verified the gate voltage is modulated to avoid the increase of the output current over the limitation value.

Figure below shows typical output current waveforms with different load conditions.

Figure 16. Current limitation with different load conditions

AM14996v1

## 7.2 Thermal protection

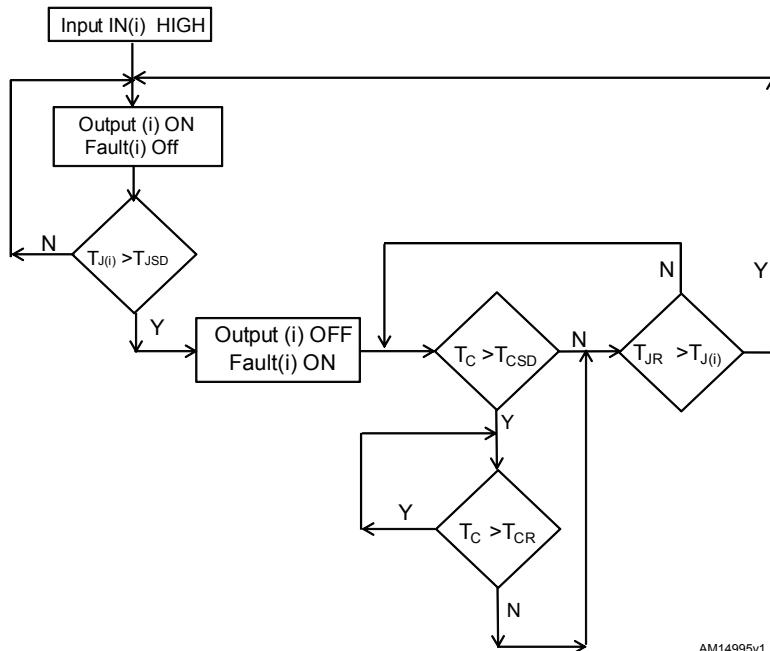

The device is protected against overheating in case of overload conditions. During the driving period, if the output is overloaded, the device suffers two different thermal stresses, the former related to the junction, and the latter related to the case.

The two faults have different trigger thresholds: the junction protection threshold is higher than the case protection one; generally the first protection, that is active in thermal stress conditions, is the junction thermal shutdown. The output is turned off when the temperature is higher than the related threshold and turned back on when it goes below the reset threshold. This behavior continues until the fault on the output is present.

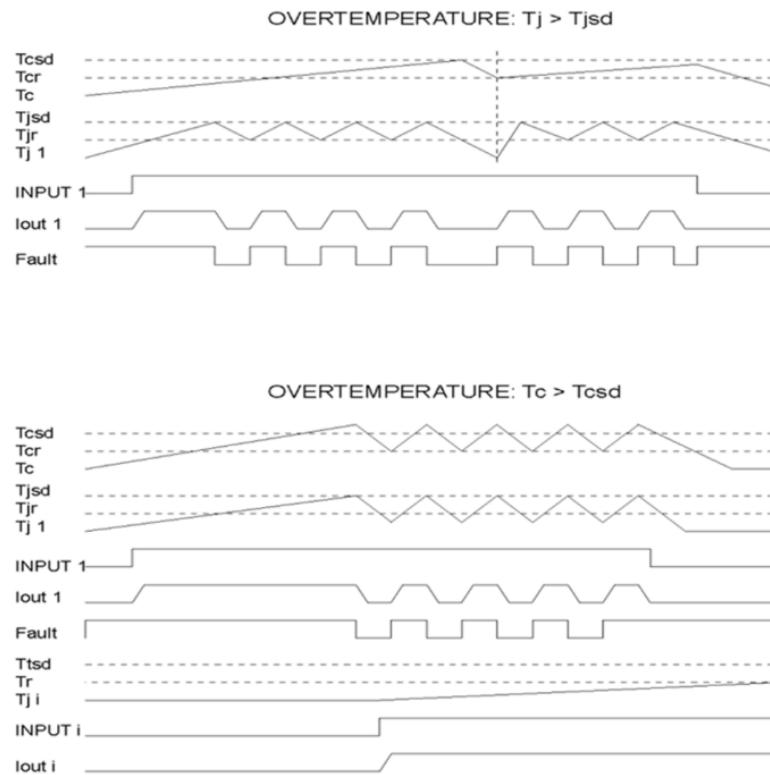

If the thermal protection is active and the temperature of the package increases over the fixed case protection threshold, the case protection is activated and the output is switched off and back on when the junction temperature of each channel in fault and case temperature is below the respective reset thresholds.

Below figures show respectively the thermal protection behavior, and the typical temperature trends and output vs. input state.

Figure 17. Thermal protection flowchart

AM14995v1

**Figure 18. Thermal protection**

## 8

## Reverse polarity protection

Reverse polarity protection can be implemented on board using two different solutions:

1. Placing a resistor ( $R_{GND}$ ) between IC GND pin and load GND
2. Placing a diode between IC GND pin and load GND

If option 1 is selected, the minimum resistance value has to be selected according to the following equation:

$$R_{GND} \geq V_{CC}/I_{GNDcc}$$

where  $I_{GNDcc}$  is the DC reverse ground pin current and can be found in [Section 3 Absolute maximum ratings](#) of this datasheet.

Power dissipated by  $R_{GND}$  during reverse polarity situations is:

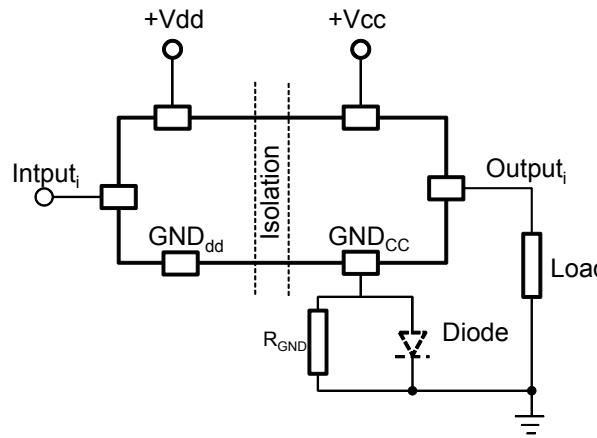

$$P_D = (V_{CC})^2/R_{GND}$$

If option 2 is selected, the diode has to be chosen by taking into account  $V_{RRM} > |V_{CC}|$  and its power dissipation capability:

$$P_D \geq I_S * V_F$$

**Note:** *In normal conditions (no reverse polarity), due to the diode, there is a voltage drop between GND of the device and GND of the system.*

**Figure 19. Reverse polarity protection**

GIPD2611131255LM

This schematic can be used with any type of load.

## 9 Reverse polarity on Vdd

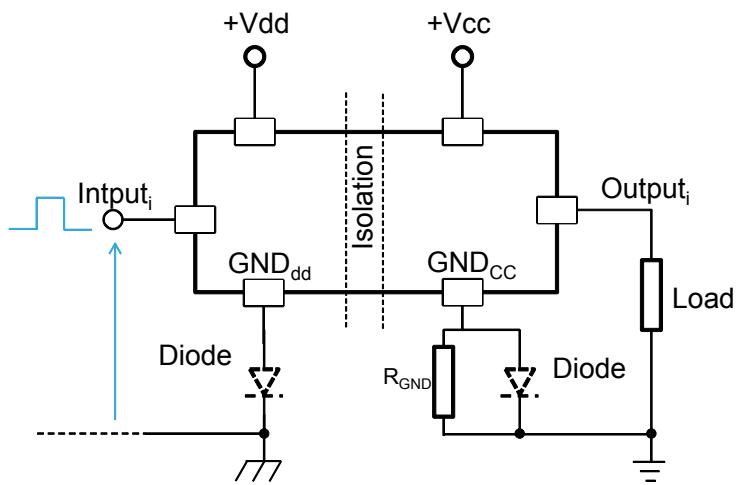

The reverse polarity on  $V_{dd}$  can be implemented on board by placing a diode between  $GND_{dd}$  pin and GND digital ground.

The diode has to be chosen by taking into account  $V_{RRM} > |V_{dd}|$  and its power dissipation capability:

$$P_D \geq I_{dd} * V_F$$

**Note:** *In normal conditions (no reverse polarity), due to the diode, there is a voltage drop between  $GND_{dd}$  of the device and digital ground of the system.*

**Figure 20. Reverse polarity protection on  $V_{dd}$**

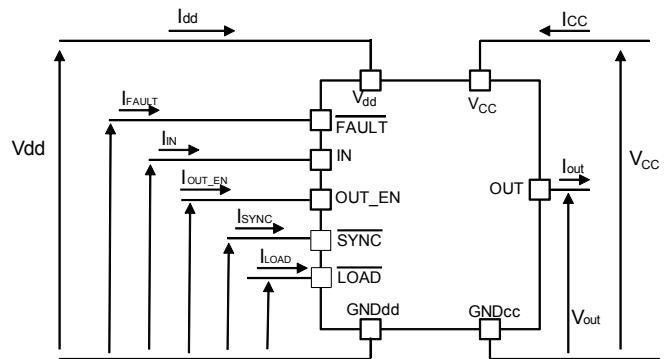

GIPD2611131302LM

## 10 Conventions

### 10.1 Supply voltage and power output conventions

## 12 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

### 12.1 PowerSO-36 package information

**Figure 23.** PowerSO-36 package outline

**Table 15.** PowerSO-36 package mechanical data

Dim.	mm		
	Min.	Typ.	Max.
A			3.60
a1	0.10		0.30
a2			3.30
a3	0		0.10
b	0.22		0.38
c	0.23		0.32
D	15.80		16.00
D1	9.40		9.80
E	13.90		14.50
E1	10.90		11.10
E2			2.90
E3	5.8		6.2
e		0.65	
e3		11.05	
G	0		0.10
H	15.50		15.90

Dim.	mm		
	Min.	Typ.	Max.
h			1.10
L	0.80		1.10
N			10°
S	0°		8°

## 12.2 Footprint recommended data

Figure 24. Footprint recommended data

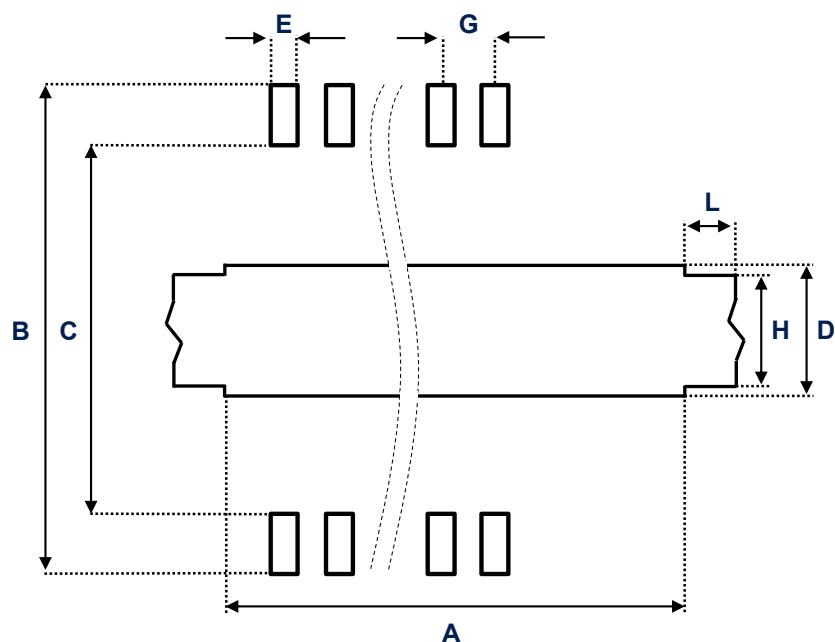

Table 16. Footprint data

Dim	mm
A	9.5
B	14.7 - 15.0
C	12.5 - 12.7
D	6.3
E	0.42
G	0.65
H	4.1
L	3.2

## 12.3 Tube shipment information

Figure 25. Tube shipment information

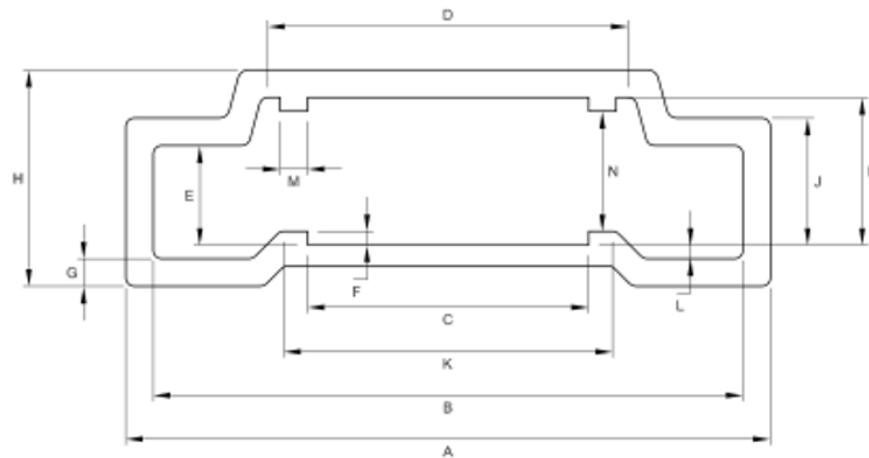

Table 17. Tube mechanical data

Dim	mm
A	18.80
B	17.2±0.2
C	8.20±0.2
D	10.90±0.2
E	2.90±0.2
F	0.40
G	0.80
H	6.30
I	4.30±0.2
J	3.7±0.2
K	9.4
L	0.40
M	0.80
N	3.50±0.2

## 12.4 Tape and reel shipment information

Figure 26. Tape specifications

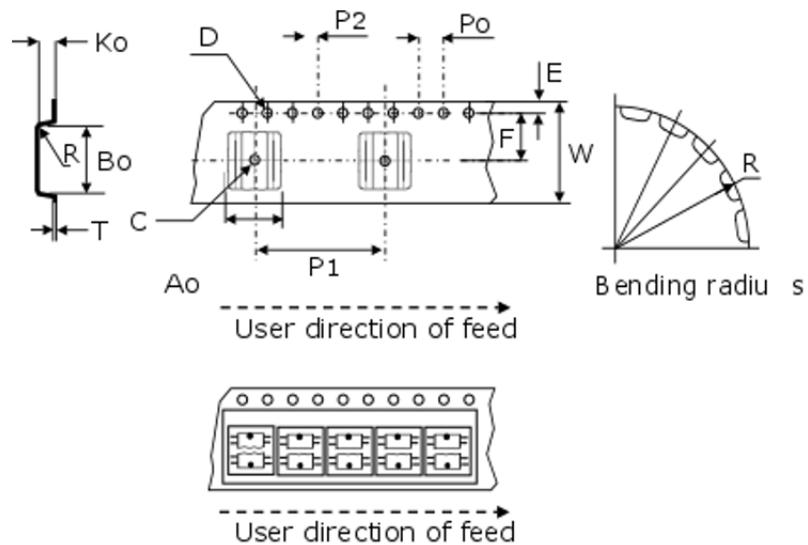

Table 18. Tape mechanical data

Dim	mm
D	1.50+0.1/0
E	1.75 ±0.1
Po	4.00 ±0.1
Tmax	0.40
D1min	1.50
F	11.5 ±0.05
Kmax	6.50
P2	2.00 ±0.1
R	50
W	24.00 ±0.30
P1	24.00
AO, BO, KO,	0.05 min to 1.0 max

Figure 27. Reel specifications

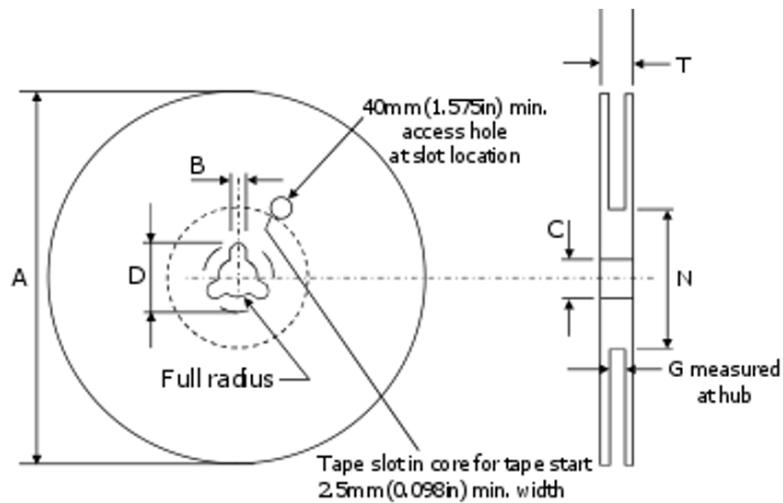

Table 19. Reel mechanical data

Dim	mm
Tape size	24.0±0.30
Amax	330.0
Bmin	1.5
C	13.0±0.20
Dmin	20.2
Nmin	60
G	24.4+2/-0
Tmax	30.4

## 13 Ordering information

**Table 20. Ordering information**

Order code	Package	Packing
ISO8200B	PowerSO-36	Tube
ISO8200BTR	PowerSO-36	Tape and reel

## Revision history

**Table 21. Document revision history**

Date	Revision	Changes
19-Oct-2012	1	Initial release.
01-Jul-2013	2	Updated <i>Figure 24: Footprint recommended data</i> and <i>Table 15: Footprint data</i> .
28-Oct-2013	3	Document status promoted from preliminary to production data. Added IEC bullet to features. Updated <i>Table 4</i> , <i>Table 6</i> , <i>Table 7</i> , and <i>Table 9</i> . Deleted table titled: "Insulation and safety-related specifications" and table titled: "Device immunity specifications". Changed <i>Table 10: IEC 60747-5-2 insulation characteristics</i> Changed <i>Figure 10</i> .
12-Nov-2013	4	Added to <i>Table 10 CLR</i> and <i>CPG</i> parameters.
29-Nov-2013	5	Removed VIORM parameter from <i>Table 10</i> . Updated <i>Section 8: Reverse polarity protection</i> . Added <i>Section 9: Reverse polarity on Vdd</i> . Changed <i>Figure 19</i> . Added <i>Figure 20</i> .
24-Jan-2014	6	Changed <i>Figure 7</i> . Added note to <i>Table 3</i> . Added test conditions: $T_J = 125^\circ\text{C}$ to <i>Table 4</i> . Added typ. and max. values of $I_{dd}$ to <i>Table 5</i> . Added max. values of $t_d(\text{ON})$ and $t_d(\text{OFF})$ to <i>Table 7</i> . Added typ. and max. values of $t_p(\text{OUT\_EN})$ to <i>Table 9</i> . Added $t_{\text{jitter}(\text{DCM})}$ value to <i>Table 9</i> .
03-Feb-2014	7	Updated <i>Figure 12</i> .
06-Feb-2014	8	Updated <i>Figure 12</i> and <i>Table 9</i>
22-Apr-2014	9	Updated EAS parameter in <i>Table 2</i> . Updated $I_{\text{PEAK}}$ parameter in <i>Table 6</i> . Updated mechanical data.
03-Jul-2017	10	Updated features, <i>Table 1</i> . Pin description, <i>Section 5 Electrical characteristics</i> and <i>Section 6.4 Fault indication</i> .
17-Oct-2019	11	Updated features ,updated the name of the last Pin in <i>Table 1</i> , updated <i>Table 15</i> , added : <i>Section 12.2</i> , <i>Section 12.3</i> , <i>Section 12.4</i> , updated <i>Table 11</i> .

## Contents

<b>1</b>	<b>Block diagram</b>	<b>3</b>
<b>2</b>	<b>Pin connection</b>	<b>4</b>
