1 EVM Overview

1.1 Features

- Full-featured evaluation board for the ADS8402 (1.25 MHz), ADS8406 (1.25 MHz), and ADS8412 (2 MHz) high-speed 16-bit, single channel, parallel interface SAR-type analog-to-digital converters.
- Onboard Signal Conditioning
- Onboard Reference
- Input and Output Digital Buffers
- Onboard Decoding for Stacking Multiple EVMs

2 Analog Interface

The ADS8402/ADS8406/ADS8412EVM analog-to-digital converter has pseudo-bipolar differential input. A pseudo-bipolar differential input is a differential signal (inverting and noninverting input is 180 degrees out of phase) that is level shifted such that the signals levels are always equal to or above zero volts. The peak-to-peak amplitude on each input pin can be as large as the reference voltage. See the respective product data sheet for more information.

The ADS8402/ADS8406/ADS8412EVM comes installed with the unity gain buffer (U2) wired for single-ended into differential-out configuration. The common-mode voltage is derived from REF3040 reference IC and adjustable using a potentiometer (R9). The common mode voltage pin of the THS4503 is set to 2.0 V on the evaluation module. A single-ended input signal can be applied at pin-connector P1 or via SMA connectors J2 (noninverting input). The buffer circuit can be reconfigured for a differential input by installing resistor R6 and R8 and removing R1. The inverting leg of the differential signal should be applied to either connector P1 pin 1 or SMA connector J4 (inverting input). See [Table 1](#) for pinout of analog connector, P1. See [Section 8](#) for the EVM schematic.

Table 1. Analog Input Connector

Description	Signal Name	Connector.pin#		Signal Name	Description

Reserved	N/A	P1.19	P1.20	REF+	External Reference Input

2.1 Signal Conditioning

It is recommended that the analog input to any SAR-type converter be buffered. The amplifier circuit in Figure 1 is the buffer circuit used on the ADS8402/ADS8406/ADS8412EVM. This circuit consists of the THS4503, a high-speed fully differential amplifier configured as a single-ended into differential-out, unity gain buffer. The circuit shown in Figure 1 was optimized to achieve the ac (i.e., SNR, THD, SFDR, etc) specifications listed in the ADS8402, ADS8406, and ADS8412 data sheets. The 68-pF and 6800-pF capacitors in the signal path are polypropylene type, manufactured by WIMA Corporation. Polypropylene capacitors cause the least distortion of the input signal; therefore, they provide good dynamic performance from the converter. A low-cost alternative for the polypropylene type are C0G capacitors by TDK Corporation.

Figure 1. Input Buffer Circuit

2.2 Reference

The EVM allows users to select from three reference sources. The ADS8402/ADS8406/ADS8412EVM provides an onboard 4.096-V reference, U3. The EVM also has the provision for users to supply a reference voltage via connector P1 pin 20. The user reference voltage and onboard reference voltages can be filtered by installing amplifier U1. The ADS8402, ADS8406, and ADS8412 analog-to-digital converters have a integrated onboard reference buffer; therefore, it is not necessary to buffer the voltage externally. The reference buffer circuit on the EVM is not populated with an amplifier for this reason. The EVM comes installed with on-chip internal reference tied directly to the reference pin of the converter. See [Section 8](#) for a full schematic.

Table 2. Solder Short Jumper Setting⁽¹⁾

Reference Designator	Description	Jumper Settings	
		1-2	2-3
SJP2	On-chip internal reference applied to A/D reference pin	Installed ⁽²⁾	
	Apply reference voltage from external source		Installed
SJP3	Apply voltage to amplifier, U2, common-mode voltage pin	Installed ⁽²⁾	N/A
SJP4	Buffer onboard reference, REF3040	Installed	Not installed
	Buffer user reference voltage applied at P1 pin 20	Not installed	installed
SJP5	Select REF3040 for reference voltage	Installed	Not installed
	Select buffered reference voltage	Not Installed	Installed

(1) Designator SJP1 is not used on the EVM.

(2) Factory installed

3 Digital Interface

The ADS8402/ADS8406/ADS8412 EVM is designed for easy interfacing to multiple platforms. Samtec part numbers SSW-110-22-F-D-VS-K and TSM-110-01-T-DV-P provide a convenient dual-row header/socket combination at P2 and P3. Consult Samtec at www.samtec.com or 1-800-SAMTEC-9 for a variety of mating connector options.

Table 3. Pinout for Parallel Control Connector P2⁽¹⁾

Connector.Pin	Signal	Description
P2.1	DC_CS	Daughtercard board-select pin
P2.3		
P2.5		
P2.7	A0	Address line from processor
P2.9	A1	Address line from processor
P2.11	A2	Address line from processor
P2.13		
P2.15		
P2.17		
P2.19	INTc	Set jumper to select BUSY or inverted signal to be applied to this pin.

(1) All even numbered pins of P2 are tied to DGND.

Read ($\overline{RD}$), conversion start ($\overline{CONVST}$) and reset ($\overline{RESET}$) signals to the converter can be assigned to two different addresses in memory via jumper settings. This allows for the stacking of up to two ADS8402EVM, ADS8406EVM, and/or ADS8412EVMs into processor memory. See [Table 4](#) for jumper settings. Note that the evaluation module does not allow the chip select ($\overline{CS}$) line of the converter to be assigned to different memory locations. It is therefore suggested that the $\overline{CS}$ line be grounded or wired to an appropriate signal of the processor.

Table 4. Jumper Settings for Decoder Outputs

Reference Designator	Description	Jumper Settings	
		1-2	2-3
W2	Set A[2..0]= 0x1 to generate $\overline{RD}$ pulse	Installed ⁽¹⁾	
	Set A[2..0]=0x2 to generate $\overline{RD}$ pulse		Installed
W5	Set A[2..0]=0x3 to generate $\overline{convst}$ pulse	Installed ⁽¹⁾	
	Set A[2..0]=0x4 to generate $\overline{convst}$ pulse		Installed
W4	Set A[2..0]=0x5 to generate $\overline{RESET}$ pulse	Installed ⁽¹⁾	
	Set A[2..0]=0x6 to generate $\overline{RESET}$ pulse		Installed

The data bus is available at connector P3; see [Table 5](#) for pinout information.

(1) Factory Installed

Table 5. Data Bus Connector P3⁽¹⁾

Connector.Pin	Signal	Description
P3.1	D0	Buffered Data Bit 0 (LSB)
P3.3	D1	Buffered Data Bit 1
P3.5	D2	Buffered Data Bit 2
P3.7	D3	Buffered Data Bit 3
P3.9	D4	Buffered Data Bit 4
P3.11	D5	Buffered Data Bit 5
P3.13	D6	Buffered Data Bit 6
P3.15	D7	Buffered Data Bit 7
P3.17	D8	Buffered Data Bit 8
P3.19	D9	Buffered Data Bit 9
P3.21	D10	Buffered Data Bit 10
P3.23	D11	Buffered Data Bit 11
P3.25	D12	Buffered Data Bit 12
P3.27	D13	Buffered Data Bit 13
P3.29	D14	Buffered Data Bit 14
P3.31	D15	Buffered Data Bit 15

This evaluation module provides direct access to all the analog-to-digital converter control signals via connector J3; see [Table 6](#).

(1) All even-numbered pins of P3 are tied to DGND.

Table 6. Pinout for Converter Control Connector J3⁽¹⁾

Connector.Pin	Signal	Description
J3.1	$\overline{CS}$	Chip Select pin. Active Low
J3.3	$\overline{RD}$	Read Pin. Active Low
J3.5	$\overline{CONVST}$	Convert start pin. Active Low
J3.7	BYTE	BYTE mode pin. Used for 8-bit buses
J3.9	$\overline{RESET}$	Reset pin. Active Low
J3.11	BUSY ⁽²⁾	Converter Status Output. High when a conversion is in progress

(1) All even-numbered pins of J3 are tied to DGND.

(2) Error on silkscreen of Rev A evaluation module. J3 pin 11 reads BUS16/18. The signal connected is BUSY, as shown in [Section 8](#).

4 Power Supplies

The EVM accepts four power supplies.

- A dual $\pm V_s$ dc supply for the dual supply operational amplifiers. Maximum voltage recommended is ± 7 VDC
- A single 5-V dc supply for analog section of the board (A/D + Reference).
- A single 5-V or 3.3-V dc supply for digital section of the board (A/D + address decoder + buffers).

There are two ways to provide these voltages.

1. Wire in voltages at test points on the EVM. See [Table 7](#)

Table 7. Power Supply Test Points

Test Point	Signal	Description
TP14	+BVDD	Apply 3.3 VDC or 5 VDC. See ADC data sheet for full range.
TP11	+AVCC	Apply 5 VDC
TP12	+VA	Apply 7 VDC. Positive supply for amplifier
TP13	-VA	Apply -7 VDC. Negative supply for amplifier

2. Use the power connector J1, and derive the voltages elsewhere. The pinout for this connector is shown in [Table 8](#). If using this connector, then set W1 jumper to connect 3.3 VD or 5 VD from the connector to +BVDD. Short between pins 1-2 to select 5 VD, or short between pins 2-3 to select 3.3 VD as the source for the digital buffer voltage supply (+BVDD).

Table 8. Power Connector, J1, Pinout

Signal	Power Connector - J1		Signal
+VA (7 V)	1	2	-VA (-7V)
5 VA	3	4	N/C
DGND	5	6	AGND
N/C	7	8	N/C
3.3 VD	9	10	5 VD

5 Using the EVM

The ADS8402/ADS8406/ADS8412 EVM serves three functions

1. As a reference design
2. As a prototype board and
3. As software test platform

5.1 As a Reference Board

As a reference design, the ADS8402/ ADS8406/ADS8412EVM contains the essential circuitry to showcase the analog-to-digital converter. This essential circuitry includes the input amplifier, reference circuit, and buffers. The EVM analog input circuit is optimized for 100-kHz sine wave; therefore, users may need to adjust the resistor and capacitor values of the A/D input circuit. In ac-type applications where signal distortion is concern, polypropylene capacitors should be used in the signal path.

5.2 As a Prototype Board

As a prototype board, the buffer circuit consists of resistor pads for configuring the input as either single-ended or differential input. The input circuit can be modified to accommodate user prototype needs, whether it be evaluating another differential amplifier or limiting noise for best performance. The analog, power, and digital connectors can be made to plug into a standard 0.1-inch breadboard or cables made up to interface direct to a FPGA or processor.

5.3 As a Software Test Platform

As a software test platform, connectors P1, P2, and P3 plug into the parallel interface connectors of the 5-6K interface card. The 5-6K interface card sits on the TMS320C5000™ and TMS320C6000™ DSP Platform starter kit (DSK). The ADS8402/ADS8406/ADS8412EVM is then mapped into the processor's memory space. This card also provides an area for signal conditioning. This area can be used to install application circuit(s) for digitization by the ADS8402/ADS8406/ADS8412 analog-to-digital converter. See the 5-6K interface card user's guide ([SLAU104](#)) for more information.

The ADS8402/ADS8406/ADS8412EVM provides a simple platform for interfacing to the converter. The EVM provides standard 0.1-inch headers and sockets to wire into prototype boards. The user need only provide 3 address lines (A2, A1, A0) and address valid line (DC_ $\overline{CS}$) to connector P2. To choose which address combinations generates $\overline{RD}$, $\overline{CONVST}$, and $\overline{RESET}$, set jumpers as shown in [Table 5](#). Recall that the chip select ($\overline{CS}$) signal is not memory mapped or tied to P2; therefore, it must be controlled via a general-purpose pin or shorted to ground at J3 pin 1. If address decoding is not required, the EVM provides direct access to converter data bus via P3 and control via J3.

6 ADS8402/ADS8406/ADS8412EVM BOM

Table 9 contains a complete bill of materials for the ADS8402/ ADS8406/ADS8412 EVM. The schematic diagram is also provided for reference. Contact the Product Information Center or e-mail dataconvapps@list.ti.com for questions regarding this EVM.

FCC Warnings

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

EVM IMPORTANT NOTICE

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation kit being sold by TI is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not considered by TI to be fit for commercial use. As such, the goods being provided may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety measures typically found in the end product incorporating the goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may not meet the technical requirements of the directive.

Should this evaluation kit not meet the specifications indicated in the EVM User's Guide, the kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Please be aware that the products received may not be regulatory compliant or agency certified (FCC, UL, CE, etc.). Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE Liable to the other FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive**.

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.**

Please read the EVM User's Guide and, specifically, the EVM Warnings and Restrictions notice in the EVM User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact the TI application engineer.

Persons handling the product must have electronics training and observe good laboratory practice standards.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input voltage range of ± 6 V and the output voltage range of 0 V and 5.5 V.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 60°C. The EVM is designed to operate properly with certain components above 60°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
