SY89231U

3.2GHz Precision, LVDS ÷3, ÷5 Clock Divider

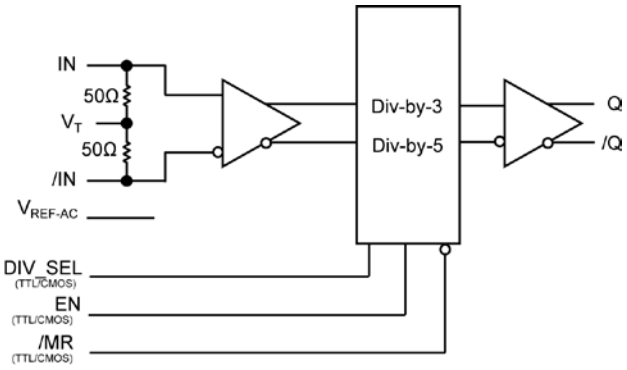
General Description

The SY89231U is a precision, low jitter 3.2GHz ÷3, ÷5 clock divider with a LVDS output. The differential input includes Micrel's unique, 3-pin internal termination architecture that allows the input to interface to any differential signal (AC- or DC-coupled) as small as 100mV (200mV$_{PP}$) without any level shifting or termination resistor networks in the signal path. The outputs are 325mV, 100K-compatible LVDS with fast rise/fall times guaranteed to be less than 200ps.

The SY89231U operates from a 2.5V ±5% supply and is guaranteed over the full industrial temperature range of –40°C to +85°C. The SY89231U is part of Micrel's high-speed, Precision Edge® product line.

All support documentation can be found on Micrel's web site at: www.micrel.com.

Block Diagram



Precision Edge®

Features

- Accepts a high-speed input and provides a precision ÷3 and ÷5 sub-rate, LVDS output
- Guaranteed AC performance over temperature and supply voltage:
  - DC-to >3.2GHz throughput
  - <810ps Propagation Delay (In-to-Q)
  - <200ps Rise/Fall times
- Ultra-low jitter design:
  - <1ps$_{RMS}$ random jitter
  - <1ps$_{RMS}$ cycle-to-cycle jitter
  - <10ps$_{PP}$ total jitter (clock)
  - <0.7ps$_{RMS}$ MUX crosstalk induced jitter
- Unique patented internal termination and VT pin accepts DC- and AC-coupled inputs (CML, PECL, LVDS)
- Wide input voltage range V_{CC} to GND
- 325mV LVDS output
- 45% to 55% Duty Cycle (÷ 3)
- 47% to 53% Duty Cycle (÷ 5)
- 2.5V ±5% supply voltage
- -40°C to +85°C industrial temperature range
- Available in 16-pin (3mm x 3mm) QFN package

Applications

- Fail-safe clock protection

Markets

- LAN/WAN
- Enterprise servers
- ATE
- Test and measurement

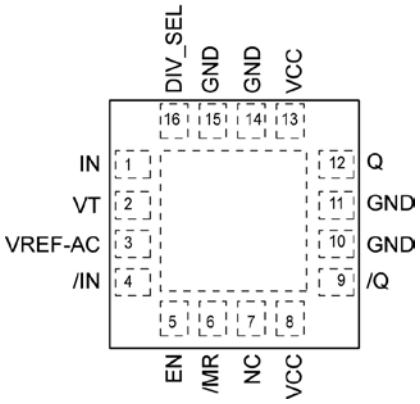
Ordering Information[1]

Part Number	Package Type	Operating Range	Package Marking	Lead Finish
SY89231UMG	QFN-16	Industrial	231U with Pb-Free bar-line Indicator	NiPdAu Pb-Free
SY89231UMGTR[2]	QFN-16	Industrial	231U with Pb-Free bar-line Indicator	NiPdAu Pb-Free

Notes:

1. Contact factory for die availability. Dice are guaranteed at T_A = 25°C, DC Electricals Only.
2. Tape and Reel.

Pin Configuration



16-Pin QFN

Pin Description

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the differential signal input to the device, which accepts AC- or DC-coupled signal as small as 100mV. The input internally terminates to a VT pin through 50Ω. Note that this input pair will default to an indeterminate state if left open. See “Input Interface Applications” subsection for more details.
2	VT	Input Termination Center-Tap: Each side of the differential input pair terminates to the VT pin. The VT pin provides a center-tap for the input (IN, /IN) to a termination network for maximum interface flexibility. See “Input Interface Applications” subsection for more details.
3	VREF-AC	Reference Voltage: This output biases to V_{CC}–1.2V. It is used for AC-coupling inputs IN and /IN. Connect VREF-AC directly to the VT pin. Bypass with 0.01µF low ESR capacitor to VCC. Due to limited drive capability, the VREF-AC pin is only intended to drive its respective VT pin. Maximum sink/source current is ±0.5mA. For more details, see “Input Interface Applications” subsection.
5	EN	Single-ended Input: This TTL/CMOS-compatible input disables and enables the output. It is internally connected to a 25kΩ pull-up resistor and will default to a logic HIGH state if left open. When disabled, Q goes LOW and /Q goes HIGH. EN being synchronous, outputs will be enabled/disabled after a rising and a falling edge of the input clock. $V_{TH} = V_{CC}/2$.
6	/MR	Single-ended Input: This TTL/CMOS-compatible input, when pulled LOW, asynchronously sets Q output LOW and /Q output HIGH. Note that this input is internally connected to a 25kΩ pull-up resistor and will default to logic HIGH state if left open. $V_{TH} = V_{CC}/2$.
7	NC	No Connect
8, 13	VCC	Positive Power Supply: Bypass with 0.1µF in parallel with 0.01µF low ESR capacitors as close to the V_{CC} pins as possible.
12, 9	Q, /Q	Differential Output: The output swing is typically 325mV. The output must be terminated with 100Ω across the pair (Q, /Q). See the “Truth Table” below for the logic function.
10, 11, 14,15	GND, Exposed Pad	Ground: Ground and exposed pad must be connected to a ground plane that is the same potential as the ground pins.
16	DIV_SEL	Single-ended Input: This TTL/CMOS-compatible input selects divide-by-3 when pulled LOW and divide-by-5 when pulled HIGH. Note that this input is internally connected to a 25kΩ pull-up resistor and will default to logic HIGH state if left open. $V_{TH} = V_{CC}/2$.

Truth Table

Inputs			Outputs	
DIV_SEL	**EN**	**/MR**	**Q**	**/Q**
X	X	0	0	1
0	1	1	÷3	÷3
1	1	1	÷5	÷5
X	0	1	0	1

Absolute Maximum Ratings[1]

Supply Voltage (V_{CC}) .....–0.5V to +4.0V
Input Voltage (V_{IN}) .....–0.5V to V_{CC}
LVPECL Output Current (I_{OUT}).....±10mA
Current (V_T)
Source or sink current on V_T .....±100mA
Input Current
Source or sink current on (IN, /IN) ..... ±50mA
Current (V_{REF-AC})
Source/Sink Current on V_{REF-AC}[4] ..... ±0.5mA
Maximum Operating Junction Temperature.....125°C
Lead Temperature (soldering, 20 sec.) .....+260°C
Storage Temperature (T_s).....–65°C to 150°C

Operating Ratings[2]

Supply Voltage (V_{CC})..... +2.375V to +2.625V
Ambient Temperature (T_A)..... –40°C to +85°C
Package Thermal Resistance [3]
QFN (θ_{JA})
Still-Air ..... 75°C/W
QFN (ψ_{JB})
Junction-to-Board.....33C/W

DC Electrical Characteristics[5]

T_A = –40°C to +85°C, unless otherwise stated.

Symbol	Parameter	Condition	Min	Typ	Max	Units
V_{CC}	Power Supply		2.375	2.5	2.625	V
I_{CC}	Power Supply Current	No load, max V_{CC}		71	95	mA
R_{IN}	Input Resistance (IN-to-V_T)		45	50	55	Ω
R_{DIFF_IN}	Differential Input Resistance (IN-to-/IN)		90	100	110	Ω
V_{IH}	Input High Voltage (IN, /IN)		1.2		V_{CC}	V
V_{IL}	Input Low Voltage (IN, /IN)		0		V_{IH}–0.1	V
V_{IN}	Input Voltage Swing (IN, /IN)	See Figure 2a. Note 6.	0.1		V_{CC}	V
V_{DIFF_IN}	Differential Input Voltage Swing |IN-/IN|	See Figure 2b.	0.2			V
V_{REF-AC}	Output Reference Voltage		V_{CC}–1.3	V_{CC}–1.2	V_{CC}–1.1	V
V_{T_IN}	Voltage from Input to V_T				1.8	V

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB. θ_{JA} and ψ_{JB} values are determined for a 4-layer board in still air unless otherwise stated.
4. Due to limited drive capability use for input of the same package only.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. V_{IN} (max) is specified when V_T is floating.

AC Electrical Characteristics[8]

V_{CC} = 2.5V ±5%; R_L = 100Ω across the outputs; T_A = –40°C to + 85°C, unless otherwise stated.

Symbol	Parameter	Condition	Min	Typ	Max	Units
f_{MAX}	Maximum Input Operating Frequency	V_{OUT} ≥ 200mV	3.2	4.5		GHz
tw	Minimum Pulse Width	IN, /IN	140			ps
t_{pd}	Differential Propagation Delay In-to-Q		410	610	810	ps
	/MR(H-L)-to-Q		210	410	610	ps
t_{RR}	Reset Recovery Time	/MR(L-H)-to-IN	400			ps
t_S EN	Set-up Time EN-to-IN	Note 9	50			ps
t_H EN	Hold Time IN-to-EN	Note 9	250			ps
t_{skew}	Part-to-Part Skew	Note 10			300	ps
t_{JITTER}	Clock Random Jitter	Note 11			1	ps_{RMS}
	Cycle-to-Cycle Jitter	Note 12			1	ps_{RMS}
	Total Jitter	Note 13			10	ps_{PP}
t_r, t_f	Output Rise/Fall Time (20% to 80%)	At full output swing.	90		200	ps
	Output Duty Cycle(÷ **3)**	Duty Cycle (input): 50%; f ≤3.2GHz, Note 14	46		54	%
	Output Duty Cycle(÷ **5)**	Duty Cycle (input): 50%; f ≤3.2GHz, Note 14	47		53	%

Notes:

8. High-frequency AC-parameters are guaranteed by design and characterization.
9. Set-up and hold times apply to synchronous applications that intend to enable/disable before the next clock cycle. For asynchronous applications, set-up and hold do not apply.
10. Part-to-Part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
11. Random Jitter is measured with a K28.7 character pattern, measured at <f_{MAX}.
12. Cycle-to-Cycle Jitter definition: the variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.
13. Total Jitter definition: with an ideal clock input of frequency <f_{MAX}, no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.
14. For Input Duty Cycle different from 50%, see “Output Duty Cycle Equation” in “Functional Description” subsection.

Functional Description

Output Duty Cycle Equation

For a non 50% input, derate the spec by:

Divide by 3:

$$(0.5 - \frac{1+\frac{X}{100}}{3}) \text{ x100, in \%}$$

Divide by 5:

$$(0.5 - \frac{2+\frac{X}{100}}{5}) \text{ x100, in \%}$$

X= input Duty Cycle, in %

Example: if a 45% input duty cycle is applied or X=45, in divide by 3 mode, the spec would expand by 1.67% to 44.3%-55.7%

Enable (EN)

EN is a synchronous TTL/CMOS-compatible input that enables/disables the outputs based on the input to this pin. Internal 25kΩ pull -up resistor defaults the input to logic HIGH if left open. Input switching threshold is $V_{CC}/2$.

The Enable function operates as follows:

1. The enable/disable function is synchronous so that the clock outputs will be enabled following a rising and a falling edge of the input clock when switching from EN=LOW to EN=HIGH.

   However, when switching from EN=HIGH to EN=LOW, the clock outputs will be disabled following an input clock rising edge and an output clock falling edge.
2. The enable/disable function always guarantees the full pulse width at the output before the clock outputs are disabled, non-depending on the divider ratio. Refer to Figure 1b for examples.

Divider Operation

The divider operation uses both the rising and falling edge of the input clock. For divide by 3, the falling edge of the second input clock cycle will determine the falling edge of the output. For divide by 5, the falling edge of the third input clock cycle. Refer to Figure 1c.

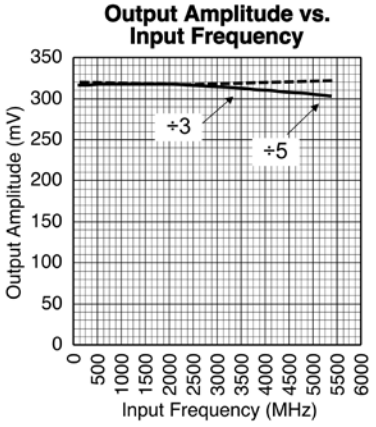
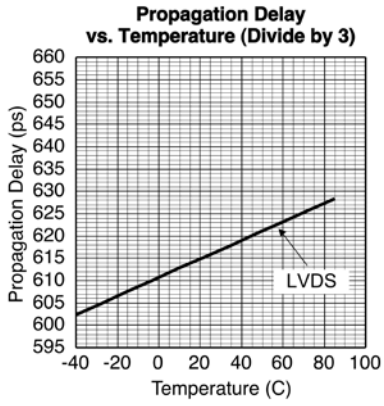
Typical Operating Characteristics

V_{CC} = 2.5V, GND = 0V, t_r / t_f ≤ 300ps, R_L = 100Ω across the outputs; T_A = 25°C, unless otherwise stated.





Functional Characteristics

V_{CC} = 2.5V, GND = 0V, V_{IN} = 350mV, Q = Divide by 3, $t_r/t_f \leq$ 300ps, R_L = 100Ω across the outputs; T_A = 25°C, unless otherwise stated.

LVDS Output Interface Applications

LVDS specifies a small swing of 325mV typical, on a nominal 1.2V common mode above ground. The common mode voltage has tight limits to permit large variations in the ground between and LVDS driver and receiver. Also, change in common mode voltage, as a function of data input, is kept to a minimum, to keep EMI low.
