## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision A (May 2020) to Revision B                                 | Page |
|----------------------------------------------------------------------------------|------|
| • Added: (See SLIA493) to the <i>Features</i> list .....                         | 1    |
| • Added : See errata TLIN1021-Q1 and TLIN2021-Q1 Duty Cycle Over $V_{SUP}$ ..... | 9    |

| Changes from Original (December 2019) to Revision A                                                                                                                                                                                                                                                                       | Page |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| • Changed note 3 to: Results given here are specific to the SAE J2962-1 Communication Transceivers Qualification Requirements - LIN. Testing performed by OEM approved independent 3 <sup>rd</sup> party up to $\pm 35V$ , EMC report available upon request. $\pm 85V$ verified internally during characterization ..... | 6    |
| • Changed $C_{LIN}$ max value from 45pF to 25pF .....                                                                                                                                                                                                                                                                     | 8    |
| • Changed text in the <i>WAKE</i> section from: The WAKE pin is a high-voltage reverse-blocked input used for the local wake-up (LWU) function. To: The WAKE pin is a high-voltage input used for the local wake-up (LWU) function. ....                                                                                  | 24   |
| • Changed text in the <i>Local Wake-Up (LWU) via WAKE Input Terminal</i> section From: The WAKE terminal is a bi-directional high-voltage reverse battery protected input To: The WAKE terminal is a bi-directional high-voltage input .....                                                                              | 27   |

## **5 Description (continued)**

The TLIN2021-Q1 also includes undervoltage detection, temperature shutdown protection, and loss-of-ground protection. In the event of a fault condition, the transmitter is immediately switched off and remains off until the fault condition is removed.

## 6 Pin Configuration and Functions

### Pin Functions

| PIN              |     | TYPE         | DESCRIPTION                                                                                                               |
|------------------|-----|--------------|---------------------------------------------------------------------------------------------------------------------------|
| NAME             | NO. |              |                                                                                                                           |
| RXD              | 1   | Digital      | LIN receive data output, open-drain                                                                                       |
| EN               | 2   | Digital      | Sleep mode control input, integrated pull-down                                                                            |
| WAKE             | 3   | High Voltage | Local wake-up input, high voltage                                                                                         |
| TXD              | 4   | Digital      | LIN transmit data input, integrated pulled down - active low after a local wake-up event                                  |
| GND              | 5   | GND          | Ground connection                                                                                                         |
| LIN              | 6   | Bus IO       | LIN bus input/output line                                                                                                 |
| V <sub>SUP</sub> | 7   | Supply       | High-voltage supply from the battery                                                                                      |
| INH              | 8   | High Voltage | Inhibit output to control system voltage regulators and supplies, high voltage                                            |
| Thermal Pad      | —   |              | Electrically connected to GND, connect the thermal pad to the printed circuit board (PCB) ground plane for thermal relief |

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                     |                                                                                                                             | MIN  | MAX                             | UNIT |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------|------|---------------------------------|------|
| $V_{SUP}$           | Supply voltage range (ISO 17987)                                                                                            | –0.3 | 60                              | V    |
| $V_{LIN}$           | LIN Bus input voltage (ISO 17987)                                                                                           | –60  | 60                              | V    |
| $V_{WAKE}$          | WAKE pin input voltage                                                                                                      | –0.3 | 60                              | V    |
| $V_{INH}$           | INH pin output voltage range                                                                                                | –0.3 | 60 and $V_O \leq V_{SUP} + 0.3$ | V    |
| $V_{LOGIC\_INPUT}$  | Logic input voltage                                                                                                         | –0.3 | 6                               | V    |
| $V_{LOGIC\_OUTPUT}$ | Logic output voltage                                                                                                        | –0.3 | 6                               | V    |
| $I_O$               | Digital pin output current                                                                                                  |      | 8                               | mA   |
| $I_{O(INH)}$        | Inhibit output current                                                                                                      |      | 4                               | mA   |
| $I_{O(WAKE)}$       | WAKE output current due to ground shift ( $V_{WAKE} \leq V_{GND} - 0.3$ V thus current out of the WAKE pin must be limited) |      | 3                               | mA   |
| $T_J$               | Junction Temp                                                                                                               | –55  | 165                             | °C   |
| $T_{stg}$           | Storage temperature                                                                                                         | –65  | 150                             | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 7.2 ESD Ratings

(3) See errata [TLIN1021-Q1](#) and [TLIN2021-Q1 Duty Cycle Over  \$V\_{SUP}\$](#)

(4) Duty cycle LIN driver bus load conditions ( $C_{LINBUS}$ ,  $R_{LINBUS}$ ): Load1 = 1 nF; 1 k $\Omega$  / Load2 = 6.8 nF; 660  $\Omega$  / Load3 = 10 nF; 500  $\Omega$ .

(5) Duty cycles 3 and 4 are defined for 10.4-kbps operation. The TLIN2029 meets these lower data rate requirements while it is also capable of the higher speed 20-kbps operation as specified by duty cycles 1 and 2. SAE J2602 derives propagation delay equations from the LIN 2.0 duty cycle definitions, for details see the SAE J2602 specification.

## 9 Detailed Description

### 9.1 Overview

The TLIN2021-Q1 is a local interconnect network (LIN) physical layer transceiver, compliant to LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2A, SAE J2602-1, SAE J2602-2, ISO 17987-4, and ISO 17987-7 standards. LIN is a low-speed universal asynchronous receiver transmitter (UART) communication protocol focused on automotive in-vehicle networking.

The TLIN2021-Q1 transmitter supports data rates from 2.4 kbps to 20 kbps and the receiver supports data rates up to 100 kbps for end-of-line programming. The TLIN2021-Q1 controls the state of the LIN bus via the TXD pin and reports the state of the bus via its open-drain RXD output pin. The LIN protocol data stream on the TXD input is converted by the TLIN2021-Q1 into a LIN bus signal using an optimized electromagnetic emissions current-limited wave-shaping driver as outlined by the LIN physical layer specification. The receiver converts the data stream to logic-level signals that are sent to the microcontroller through the open-drain RXD pin. The LIN bus has two states: dominant state (voltage near ground) and recessive state (voltage near battery). In the recessive state, the LIN bus is pulled high by the transceivers internal pull-up resistor (45 k $\Omega$ ) and a series diode. No external pull-up components are required for slave applications. Master applications require an external pull-up resistor (1 k $\Omega$ ) plus a series diode per the LIN specification.

The TLIN2021-Q1 is designed to support 24 V applications with a wide input voltage operating range and also supports low-power sleep mode. The device supports wake-up from low-power mode via wake over LIN, the WAKE pin, or the EN pin. The device allows for system-level reductions in battery current consumption by selectively enabling the various power supplies that may be present on a node through the TLIN2021-Q1 INH output pin.

The TLIN2021-Q1 integrates ESD protection and fault protection which allow for a reduction in the required external components in the applications. The device prevents back-feed current through LIN to the supply input in case of a ground shift or supply voltage disconnection.

The TLIN2021-Q1 also include undervoltage detection, temperature shutdown protection, and loss-of-ground protection. In the event of a fault condition, the transmitter is immediately switched off and remains off until the fault condition is removed.

## 9.3 Feature Description

### 9.3.1 LIN

This high voltage input/output pin is the single-wire LIN bus transmitter and receiver. The LIN pin can survive transient voltages up to 60 V. Reverse currents from the LIN to supply ( $V_{SUP}$ ) are minimized with blocking diodes, even in the event of a ground shift or loss of supply ( $V_{SUP}$ ).

#### 9.3.1.1 LIN Transmitter Characteristics

The LIN transmitter has thresholds and AC switching parameters according to the LIN specification. The transmitter is a low side transistor with internal current limitation and thermal shutdown. During a thermal shutdown condition, the transmitter is disabled to protect the device. There is an internal pull-up resistor with a serial diode structure to  $V_{SUP}$ , so no external pull-up components are required for LIN slave applications. An external pull-up resistor and series diode to  $V_{SUP}$  must be added when the device is used for in a master application per the LIN specification.

#### 9.3.1.2 LIN Receiver Characteristics

The receiver characteristic thresholds are proportional to the device supply pin in accordance to the LIN specification.

The receiver is capable of receiving higher data rates, > 100 kbps, than supported by LIN or SAEJ2602 specifications. This allows the TLIN2021-Q1 to be used for high-speed downloads at the end-of-line production or other applications. The actual data rate achievable depends on system time constants (bus capacitance and pull-up resistance) and driver characteristics used in the system.

## Feature Description (continued)

### 9.3.1.2.1 Termination

There is an internal pull-up resistor with a serial diode structure to  $V_{SUP}$ , so no external pull-up components are required for the LIN slave applications. An external pull-up resistor (1 k $\Omega$ ) and a series diode to  $V_{SUP}$  must be added when the device is used for master node applications as per the LIN specification.

Figure 24 shows a Master Node configuration and how the voltage levels are defined

Figure 24. Master Node Configuration with Voltage Levels

### 9.3.2 TXD

TXD is the interface to the MCU LIN protocol controller or SCI and UART that is used to control the state of the LIN output. When TXD is low the LIN output is dominant (near ground) and when TXD is high the LIN output is recessive (near  $V_{SUP}$ ), see Figure 24.

The TXD input structure is compatible with 3.3 V and 5 V microcontrollers and integrates a weak pull-down resistor. The LIN bus is protected from being stuck dominant through a system failure driving TXD low through the dominant state timer-out timer. When a change of state on the WAKE pin initiates a local wake-up event, the TXD pin is pulled hard to ground indicating a local wake-up event. The hard pull to ground is released upon the rising edge on the EN pin. If an external pull-up resistor is added to the TXD pin to the microcontrollers IO voltage then TXD is pulled high to indicate a remote wake-up event.

### 9.3.3 RXD

RXD is the interface to the MCU's LIN protocol controller or SCI and UART, which reports the state of the LIN bus voltage. LIN recessive (near  $V_{SUP}$ ) is represented by a high level on the RXD and LIN dominant (near ground) is represented by a low level on the RXD pin. The RXD output structure is an open-drain output stage. This allows the device to be used with 3.3 V and 5 V microcontrollers. If the microcontrollers RXD pin does not have an integrated pull-up, an external pull-up resistor to the microcontrollers IO supply voltage is required. In standby mode, the RXD pin is driven low to indicate a wake-up request.

### 9.3.4 $V_{SUP}$

$V_{SUP}$  is the power supply pin.  $V_{SUP}$  is connected to the battery through an external reverse-blocking diode, see Figure 24. If there is a loss of power at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

## Feature Description (continued)

### 9.3.5 GND

GND is the device ground connection. The device can operate with a ground shift as long as the ground shift does not reduce the  $V_{SUP}$  below the minimum operating voltage. If there is a loss of ground at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

### 9.3.6 EN

EN controls the operational modes of the device. When EN is high the device is in normal operating mode allowing a transmission path from TXD to LIN and from LIN to RXD. When EN is low, the device is put into sleep mode and there are no transmission paths available. The device can enter normal mode only after wake-up. EN has an internal pull-down resistor to ensure the device remains in low power mode even if EN floats.

### 9.3.7 WAKE

The WAKE pin is a high-voltage input used for the local wake-up (LWU) function. This function is explained further in [Local Wake-Up \(LWU\) via WAKE Input Terminal](#) section. The pin is defaulted to bidirectional edge trigger, meaning it recognizes a local wake-up (LWU) on a rising or falling edge of WAKE pin transition.

### 9.3.8 INH

The TLIN2021-Q1 inhibit, INH, output pin can be used to control the enable of system power-management devices allowing for a significant reduction in battery quiescent current consumption while the application is in sleep mode. The INH pin has two states: driven high and high impedance. When the INH pin is driven high, the terminal shows  $V_{SUP}$  minus a diode voltage drop. In the high impedance state the output is left floating. The INH pin is high in the normal and standby modes and is low when in sleep mode. A 100 k $\Omega$  load can be added to the INH output to ensure a fast transition time from the driven high state to the low state and to also force the pin low when left floating.

The INH terminal should be considered a high-voltage logic terminal and not a power output. Thus should be used to drive the EN terminal of the systems power-management device and not used as a switch for the power-management supply itself. This terminal is not reverse battery protected and thus should not be connected outside the system module.

### 9.3.9 Local Faults

The TLIN2021-Q1 has several protection features that are described as follows.

#### 9.3.10 TXD Dominant Time-Out (DTO)

While the LIN driver is in active mode a TXD DTO circuit prevents the local node from blocking network communication in event of a hardware or software failure where TXD is held dominant longer than the time-out period  $t_{TXD\_DTO}$ . The TXD DTO circuit is triggered by a falling edge on TXD. If no rising edge is seen before the time-out constant of the circuit,  $t_{TXD\_DTO}$ , expires the LIN driver is disabled releasing the bus line to the recessive level. This keeps the bus free for communication between other nodes on the network. The LIN driver is re-activated on the next dominant to recessive transition on the TXD terminal, thus clearing the dominant time-out. During this fault, the transceiver remains in normal mode, the integrated LIN bus pull-up termination remains on, and the LIN receiver and RXD terminal remain active reflecting the LIN bus data.

The TXD pin has an internal pull-down to ensure the device fails to a known state if TXD is disconnected. If EN pin is high at power-up, the TLIN2021-Q1 enters normal mode. With the internal TXD connected low, the DTO timer starts. To avoid a  $t_{TXD\_DTO}$  fault, a recessive signal should be put onto the TXD pin before the  $t_{TXD\_DTO}$  timer expires, or the device should be into sleep mode by connecting EN pin low.

#### 9.3.11 Bus Stuck Dominant System Fault: False Wake-Up Lockout

The TLIN2021-Q1 contains logic to detect bus stuck dominant system faults and prevents the device from waking up falsely during the system fault. Upon entering sleep mode, the device detects the state of the LIN bus. If the bus is dominant, the wake-up logic is locked out until a valid recessive on the bus clears the bus stuck dominant fault, preventing excessive current use, see [Figure 25](#) and [Figure 26](#).

## Feature Description (continued)

Copyright © 2019, Texas Instruments Incorporated

**Figure 26. Bus Fault: Entering Sleep Mode With Bus Stuck Dominant Fault, Clearing, and Wake-up**

### 9.3.12 Thermal Shutdown

The TLIN2021-Q1 transmitter is protected by limiting the current. If the junction temperature,  $T_J$ , of the device exceeds the thermal shutdown threshold,  $T_J > T_{SDR}$ , the device puts the LIN transmitter into the recessive state. Once the over temperature fault condition has been removed and the junction temperature has cooled beyond the hysteresis temperature, the transmitter is re-enabled. During this fault, the transceiver remains in normal mode, the integrated LIN bus pull-up termination remains on, the LIN receiver and RXD terminal remain active reflecting the LIN bus data.

### 9.3.13 Under Voltage on $V_{SUP}$

The TLIN2021-Q1 contains a power on reset circuit to avoid false bus messages during under voltage conditions when  $V_{SUP}$  is less than  $UV_{SUP}$ .

### 9.3.14 Unpowered Device

In automotive applications, some LIN nodes in a system can be unpowered, ignition supplied, while others in the network remains powered by the battery. The TLIN2021-Q1 has extremely low unpowered leakage current from the bus so an unpowered node does not affect the network or load it down.

## 9.4 Device Functional Modes

The TLIN2021-Q1 has three functional modes of operation: normal, sleep, and standby. The next sections describe these modes and how the device transitions between the different modes. [Figure 27](#) graphically shows the relationship while [Table 1](#) shows the state of pins.

## Device Functional Modes (continued)

Table 1. Operating Modes

| MODE    | EN   | TXD                                                                                     | RXD          | INH      | LIN BUS TERMINATION  | TRANSMITTER | COMMENT                                          |
|---------|------|-----------------------------------------------------------------------------------------|--------------|----------|----------------------|-------------|--------------------------------------------------|
| Sleep   | Low  | Weak pull-down                                                                          | Floating     | Floating | Weak current pull-up | Off         |                                                  |
| Standby | Low  | weak pull-down if LIN bus wake-up; Strong pull-down if a local wake-up event (WAKE pin) | Low          | High     | 45 kΩ                | Off         | Wake-up event detected, waiting on MCU to set EN |
| Normal  | High | High: recessive state<br>Low: dominant state                                            | LIN Bus Data | High     | 45 kΩ                | On          | LIN transmission up to 20 kbps                   |

Figure 27. Operating State Diagram

### 9.4.1 Normal Mode

The EN pin controls the mode of the device. If the EN pin is high at power-up the device powers-up in normal mode, if the EN is low at power-up the device powers-up in standby mode. In normal mode the receiver and transmitter fully operational. The LIN transmitter transmits data from the LIN controller to the LIN bus up to the LIN specified maximum data rate of 20 kbps. The LIN receiver detects the data stream on the LIN bus up to data rates of 100 kbps and outputs the data on RXD output for the LIN controller. Upon an EN pin transition from from low to high the TLIN2021-Q1 transitions from sleep mode to normal mode in  $t \geq t_{\text{NOMINT}}$ .

### 9.4.2 Sleep Mode

Sleep mode is the lowest power mode of the TLIN2021-Q1 and is only entered from normal mode when the EN pin transitions from high to low for  $t > t_{\text{MODE\_CHANGE}}$ . In sleep mode, the LIN driver and receiver are switched off, the LIN bus is weakly pulled up, and the transceiver cannot send or receive data. The INH pin is switched to a floating output in sleep mode causing any system power elements controlled by the INH pin to be switched off thus reducing the system power consumption. While the device is in sleep mode, the following conditions exist:

- The LIN bus driver is disabled and the internal LIN bus termination is switched off to minimize power loss if LIN is short circuited to ground.
- A weak current pull-up is active to prevent false wake-up events in case an external connection to the LIN bus is lost.
- The normal receiver is disabled.
- EN input, WAKE pin and LIN wake-up receiver are active.

The TLIN2021-Q1 supports three methods for wake-up from sleep mode:

- Wake-up over the LIN bus via the LIN wake-up receiver.
- Local wake-up via the WAKE pin.
- Local wake-up via the EN pin. The EN pin must be set high for  $t > t_{\text{NOMINT}}$  in order for the device to wake-up.

### 9.4.3 Standby Mode

Standby mode is entered whenever a wake-up event occurs through LIN bus or the WAKE pin while the device is in sleep mode. In standby mode, the LIN bus slave termination circuit, 45 k $\Omega$ , is on. When a wake-up event occurs and the TLIN2021-Q1 enters standby mode the RXD pin is driven low signaling the wake-up event to the LIN controller.

The TLIN2021-Q1 exits standby mode and transitions to normal mode when the EN pin is set high for longer than  $t_{\text{MODE\_CHANGE}}$  where the normal LIN transmitter and receiver are fully operational and bi-directional communication is possible.

### 9.4.4 Wake-Up Events

There are three ways to wake-up the TLIN2021-Q1 from sleep mode:

- Remote wake-up initiated by the falling edge of a recessive-to-dominant state transition on the LIN bus where the dominant state is held for longer than  $t_{\text{LINBUS}}$  filter time. After the  $t_{\text{LINBUS}}$  filter time has been met a rising edge on the LIN bus going from dominant-to-recessive initiates a remote wake-up event. The pattern and  $t_{\text{LINBUS}}$  filter time used for the LIN wake-up prevents noise and bus stuck dominant faults from causing false wake requests.
- A local wake-up event due to the EN pin being set high for  $t > t_{\text{MODE\_CHANGE}}$ .
- A local wake-up event due to a change in voltage level on the WAKE pin for  $t > t_{\text{WAKE}}$ .

#### 9.4.4.1 Local Wake-Up (LWU) via WAKE Input Terminal

The WAKE terminal is a bi-directional high-voltage input which can be used for local wake-up (LWU) requests via a voltage transition. A LWU event is triggered on either a low-to-high or high-to-low transition since it has bi-directional input thresholds. The WAKE pin could be used with a switch to  $V_{\text{SUP}}$  or to ground. If the terminal is unused it should be pulled to  $V_{\text{SUP}}$  or ground to avoid unwanted parasitic wake-up events. When a LWU event takes place the TXD pin is pulled hard to GND letting the LIN controller know that the wake-up event was due to the WAKE pin and not a wake over LIN event.

The LWU circuitry is active in standby mode and sleep mode. If a valid LWU event occurs in standby mode, the device remains in standby mode and drive the RXD output low. If a valid LWU event occurs in sleep mode, the device transitions to standby mode and drive the RXD output low. The LWU circuitry is not active in normal mode. To minimize system level current consumption, the internal bias voltages of the terminal follows the state on the terminal with a delay of  $t_{\text{WAKE(MIN)}}$ . A constant high level on WAKE has an internal pull-up to  $V_{\text{SUP}}$ , and a constant low level on WAKE has an internal pull-down to GND.

**Figure 28. Local Wake-Up – Rising Edge**

**Figure 29. Local Wake-Up – Falling Edge**

Copyright © 2019, Texas Instruments Incorporated

#### **9.4.4.2 Wake-Up Request (RXD)**

When the TLIN2021-Q1 encounters a wake-up event from the WAKE pin, or the LIN bus the RXD output is driven low until EN is asserted high, the device enters normal mode. Once the device enters normal mode, the wake-up event is cleared, and the RXD output is released. The RXD output is fully operation and reflects the receiver output from the LIN bus.

## 10 Application and Implementation

## NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 10.1 Application Information

The TLIN2021-Q1 can be used in both a slave application and a master application in a LIN network.

## 10.2 Typical Application

The device integrates a 45 k $\Omega$  pull-up resistor and series diode for slave applications. For master applications, an external 1 k $\Omega$  pull-up resistor with series blocking diode can be used. shows the device being used in both master and slave applications.

### Figure 30. Typical LIN Bus

## Typical Application (continued)

### 10.2.1 Design Requirements

The RXD output structure is an open-drain output stage which allows the TLIN2021-Q1 to be used with 3.3-V and 5-V controllers. If the RXD pin of the controller does not have an integrated pull-up, an external pull-up resistor to the controllers IO voltage is required. The external pull-up resistor value should be between 1 kΩ to 10 kΩ. The  $V_{SUP}$  pin of the device should be decoupled with a 100-nF capacitor by placing it close to the  $V_{SUP}$  supply pin. The system should include additional decoupling on the  $V_{SUP}$  line as needed per the application requirements.

### 10.2.2 Detailed Design Procedures

#### 10.2.2.1 Normal Mode Application Note

When using the TLIN2021-Q1 in systems which are monitoring the RXD pin for a wake-up request, special care should be taken during the mode transitions. The output of the RXD pin is indeterminate for the transition period between states as the receivers are switched. The application software should not look for an edge on the RXD pin indicating a wake-up request until  $t_{MODE\_CHANGE}$  has been met. This is shown in Figure 21

#### 10.2.2.2 TXD Dominant State Time-Out Application Note

The maximum dominant TXD time allowed by the TXD dominant state time-out limits the minimum possible data rate of the device. The LIN protocol has different constraints for master and slave applications thus there are different maximum consecutive dominant bits for each application case thus different minimum data rates.

### 10.2.3 Application Curves

Figure 31 and Figure 32 show the propagation delay from the TXD pin to the LIN pin for the dominant to recessive and recessive to dominant edges.

## 11 Power Supply Recommendations

The TLIN2021-Q1 was designed to operate directly from a car battery, or any other DC supply ranging from 4.5 V to 45 V. The  $V_{SUP}$  pin of the device should be decoupled with a 100-nF capacitor by placing it close to the  $V_{SUP}$  supply pin. The system should include additional decoupling on the  $V_{SUP}$  line as needed per the application requirements.

## 12 Layout

For the PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. Placement at the connector also prevents these noisy events from propagating further into the PCB and system.

### 12.1 Layout Guidelines

- **Pin 1 (RXD):** The RXD pin is an open-drain output and requires an external pull-up resistor in the range of 1 k $\Omega$  and 10 k $\Omega$  to function properly. If the controller paired with the transceiver does not have an integrated pull-up, an external resistor should be placed between RXD and the supply voltage for the controller.
- **Pin 2 (EN):** EN is an input pin that is used to place the device in low-power sleep mode. If this feature is not used the pin should be connected to the supply voltage for the controller through a series resistor using a pull-up value between 1 k $\Omega$  and 10 k $\Omega$ . Additionally, a series resistor may be placed on the pin to limit current on the digital lines in the case of an over voltage fault.
- **Pin 3 (WAKE):** SW1 is oriented in a low-side configuration which is used to implement a local WAKE event. The series resistor R5 is needed for protection against over current conditions as it limits the current into the WAKE pin when the ECU has lost its ground connection. The pull-up resistor R4 is required to provide sufficient current during stimulation of a WAKE event. In this layout example R4 is set to 3 k $\Omega$  and R5 is set to 33 k $\Omega$ .
- **Pin 4 (TXD):** The TXD pin is the transmit input signal to the device from the controller. A series resistor can be placed to limit the input current to the device in the case of an over-voltage on this pin. A capacitor to ground can be placed close to the input pin of the device to help filter noise.
- **Pin 5 (GND):** This is the ground connection for the device. This pin should be tied to the ground plane through a short trace with the use of two vias to limit total return inductance.
- **Pin 6 (LIN):** The LIN pin connects to the TLIN2021-Q1 to the LIN bus. For slave applications a 220 pF capacitor to ground is implemented. For master applications an additional series resistor and blocking diode should be placed between the LIN pin and the V<sub>SUP</sub> pin, see Figure 30.
- **Pin 7 (V<sub>SUP</sub>):** This is the supply pin for the device. A 100-nF capacitor should be placed close to the V<sub>SUP</sub> supply pin for local power supply decoupling.
- **Pin 8 (INH):** The INH pin is used for system power-management. A 100 k $\Omega$  load can be added to the INH output to ensure a fast transition time from the driven high state to the low state and to also force the pin low when left floating.

#### NOTE

All ground and power connections should be made as short as possible and use at least two vias to minimize the total loop inductance.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
