

9 mm × 11 mm × 2.8 mm

# 2A, Negative Output, SIMPLE SWITCHER® Power Module with 4.5V-40V Input in QFN Package

Check for Samples: LMZ34002

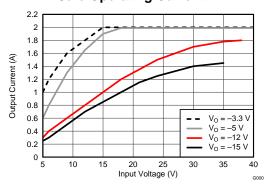

#### **FEATURES**

- Complete Integrated Power Solution Allows Small Footprint, Low-Profile Design
- Wide Input Voltage Range from 4.5 V to 40 V
- Output Adjustable from -3.0 V to -17 V
- Supplies up to 2-A of Output Current
- 45-V Surge Capability
- Synchronizes to an External Clock
- Adjustable Slow-Start
- Programmable Undervoltage Lockout (UVLO)
- Output Overcurrent Protection
- Over Temperature Protection
- Operating Temperature Range: -40°C to 85°C
- Enhanced Thermal Performance: 14°C/W
- Meets EN55022 Class B Emissions
   Integrated Shielded Inductor
- For Design Help visit http://www.ti.com/LMZ34002

#### **APPLICATIONS**

- Industrial and Motor Controls
- Automated Test Equipment
- Bipolar Amplifiers in Audio/Video
- High Density Power Systems

#### Safe Operating Current

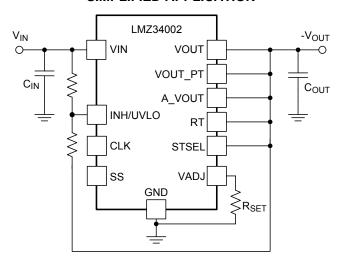

#### **DESCRIPTION**

The LMZ34002 SIMPLE SWITCHER® power module is an easy-to-use, negative output voltage power module that combines a 15-W DC/DC converter with a shielded inductor, and passives into a low profile, QFN package. This total power solution allows as few as five external components and eliminates the loop compensation and magnetics part selection process.

The 9x11x2.8 mm QFN package is easy to solder onto a printed circuit board and allows a compact design with fewer components and excellent power dissipation capability. The LMZ34002 offers the flexibility and the feature-set of a discrete design and is ideal for powering a wide range of ICs and analog circuits requiring a negative output voltage. Advanced packaging technology affords a robust and reliable power solution compatible with standard QFN mounting and testing techniques.

#### SIMPLIFIED APPLICATION

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

#### **ABSOLUTE MAXIMUM RATINGS**(1)

over operating tempe	MIN	MAX	UNIT	
	VIN	-0.3	45	V
	INH/UVLO	-0.3	5 <sup>(2)</sup>	V
	VADJ	-0.3	3 <sup>(2)</sup>	V
Input Voltage	SS	-0.3	3(2)	V
	STSEL	-0.3	3(2)	V
	RT	-0.3	3.6 <sup>(2)</sup>	V
	CLK	-0.3	3.6 <sup>(2)</sup>	V
	PH	-0.6	45	V
Output Voltage	PH 10ns Transient	-2	45	V
	VOUT	-0.6	VIN <sup>(2)</sup>	V
V <sub>DIFF</sub> (VOUT to expose thermal pad)	ed .		±200	mV
Source Current	INH/UVLO		100	μA
Sink Current	SS		200	μA
Operating Junction Temperature		-40	105 <sup>(3)</sup>	°C
Storage Temperature		-65	150	°C
Mechanical Shock	Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted		1500	G
Mechanical Vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz		20	

<sup>(1)</sup> Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) This voltage rating is referenced to A\_VOUT, not GND.

#### RECOMMENDED OPERATING CONDITIONS

over operating free-air	MIN	MAX	UNIT	
$V_{IN}$	Input Voltage	4.5	40	V
V <sub>OUT</sub>	Output Voltage	-3.0	-17	V

#### **PACKAGE SPECIFICATIONS**

	UNIT	
Weight		0.9 grams
Flammability	Meets UL 94 V-O	
MTBF Calculated reliability	Per Bellcore TR-332, 50% stress, T <sub>A</sub> = 40°C, ground benign	31.7 MHrs

#### **ORDERING INFORMATION**

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

<sup>(3)</sup> See the temperature derating curves in the Typical Characteristics section for thermal information.

#### **ELECTRICAL CHARACTERISTICS**

-40°C  $\leq$  T<sub>A</sub>  $\leq$  +85°C, V<sub>IN</sub> = 12 V, V<sub>OUT</sub> = -5.0 V, I<sub>OUT</sub> = 2.0A C<sub>IN</sub> = 2 x 2.2 µF ceramic, C<sub>OUT</sub> = 2 x 47 µF ceramic (unless otherwise noted)

- (1) This device can regulate V<sub>OUT</sub> down to 0 A, however the ripple may increase due to pulse-skipping at light loads. See Light-Load Behavior for more information. See No-Load Operation when operating at 0 A.
- The maximum current is dependant on  $V_{\text{IN}}$  and  $V_{\text{OUT}}$ , see Figure 33.
- The sum of  $V_{IN} + |V_{OUT}|$  must not exceed 50 V.
- The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external R<sub>SET</sub> resistor.
- This product is not designed to endure a sustained (> 5 sec) over-current condition.
- If this pin is left open circuit, the device operates when input power is applied. An external level-shifter is required to interface with this pin. See Output On/Off Inhibit (INH) for further guidance.
- The synchronization frequency is dependant on  $V_{IN}$  and  $V_{OUT}$  as shown in Switching Frequency.  $R_{RT}$  must be either  $0~\Omega$  or  $93.1k\Omega$ . A minimum of  $4.7~\mu$ F of ceramic external capacitance is required across the input (VIN and PGND connected) for proper operation. Locate the capacitor close to the device. See Table 1 for more details.
- The amount of required capacitance must include at least 2 x 47 µF ceramic capacitor (or 4 x 22 µF). Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients. See Table 1 for more details. See Inrush Current section when adding additional output capacitance.

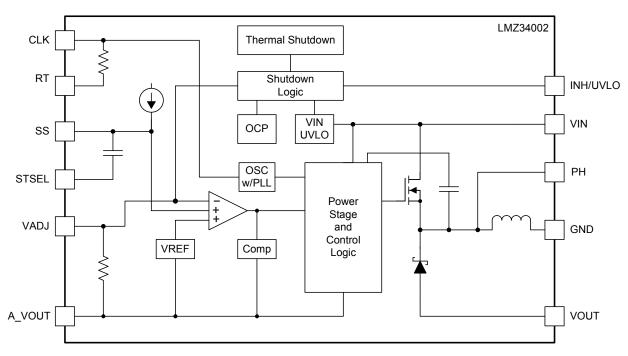

#### THERMAL INFORMATION

THERMAL METRIC <sup>(1)</sup>		LMZ34002 RKG 41 PINS	UNIT
$\theta_{JA}$	Junction-to-ambient thermal resistance (2)	14	
ΨЈТ	Ψ <sub>JT</sub> Junction-to-top characterization parameter <sup>(3)</sup>		°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter (4)	6.8	

- (1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.
- (2) The junction-to-ambient thermal resistance, θ<sub>JA</sub>, applies to devices soldered directly to a 100 mm x 100 mm double-sided PCB with 1 oz. copper and natural convection cooling. Additional airflow reduces θ<sub>JA</sub>.
- (3) The junction-to-top characterization parameter, ψ<sub>JT</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T<sub>J</sub> = ψ<sub>JT</sub> \* Pdis + T<sub>T</sub>; where Pdis is the power dissipated in the device and T<sub>T</sub> is the temperature of the top of the device.
- (4) The junction-to-board characterization parameter, ψ<sub>JB</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T<sub>J</sub> = ψ<sub>JB</sub> \* Pdis + T<sub>B</sub>; where Pdis is the power dissipated in the device and T<sub>B</sub> is the temperature of the board 1mm from the device.

#### **PIN DESCRIPTIONS**

TERMINAL NO.		DESCRIPTION					
		DESCRIPTION					
VIN	26	Input voltage. This pin supplies all power to the converter. Connect this pin to the input supply and connect bypass capacitors between this pin and GND.					
_	16						
=	17						
VOUT -	18	Negative output voltage with respect to GND. Connect these pins to the output load and connect external bypass capacitors between these pins and GND. Pad 40 should be connected to PCB VOUT planes using					
19	19	multiple vias for good thermal performance.					
_	20						
	40						
_	10						
_	11						
_	12	This is the return current path for the power stage of the device. These pins are connected to the internal					
GND	13	output inductor. Connect these pins to the load and to the bypass capacitors associated with VIN and					
	14	VOUT.					
=	15						
	39						
_	6						
_	7						
 PH	21						
	22	Phase switch node. Do not place any external component on these pins or tie them to a pin of another					
_	23	function.					
_	24						
	38						
	41						
= = =	8	VOUT and A_VOUT Connection Point. Connect VOUT to A_VOUT at these pins as shown in the Layout					
VOUT_PT	9	Considerations section. These pins are not connected to internal circuitry, and are not connected to one other.					
_	2						
DNC -	3	Do Not Connect. Do not connect these pins to GND, to another DNC pin, or to any other voltage. These pins					
_	25	are connected to internal circuitry. Each pin must be soldered to an isolated pad.					
	35						
_	1						
_	4	These pins are connected to the internal analog reference (A_VOUT) of the device. This node should be					
_	5	treated as the negative voltage reference for the analog control circuitry. Pad 37 should be connected to the					
A_VOUT	32	PCB A_VOUT plane using multiple vias for good thermal performance. Not all pins are connected together internally. All pins must be connected together externally with a copper plane or pour directly under the					
_	33	module. Connect A_VOUT to VOUT at a single point (VOUT_PT; pins 8 & 9). See Layout					
=	34	Recommendations.					
	37						
RT	30	Switching frequency adjust pin. To operate at the recommended free-running frequency, connect this pin to A_VOUT. Connecting a resistor between this pin and A_VOUT will reduce the switching frequency. See Switching Frequency section.					
CLK	31	Use this pin to synchronize to an external clock. If unused, isolate this pin from any other signal.					
INH/UVLO	27	Inhibit and UVLO adjust pin. Use an external level-shifter device to ground this pin to control the INH function. A resistor divider between this pin, A_VOUT, and VIN sets the UVLO voltage.					
SS	28	Slow-start pin. Connecting an external capacitor between this pin and A_VOUT adjusts the output voltage rise time.					
STSEL	29	Slow-start select. Connect this pin to A_VOUT to enable the internal SS capacitor.					
VADJ	36	Connecting a resistor between this pin and GND sets the output voltage. A dedicated GND sense line connected at the load will improve regulation at the load. See Figure 48 in the Layout Considerations section.

#### CAPACITOR RECOMMENDATIONS FOR THE LMZ34002 POWER SUPPLY

#### **Capacitor Technologies**

#### **Electrolytic, Polymer-Electrolytic Capacitors**

When using electrolytic capacitors, high-quality, computer-grade electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz, and are suitable when ambient temperatures are above 0°C.

#### **Ceramic Capacitors**

The performance of aluminum electrolytic capacitors is less effective than ceramic capacitors above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

#### **Tantalum, Polymer-Tantalum Capacitors**

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

#### **Input Capacitor**

The LMZ34002 requires a minimum input capacitance of 4.7 µF of ceramic type. The voltage rating of input capacitors must be greater than the maximum input voltage. The ripple current rating of the capacitor must be at least 450 mArms. Table 1 includes a preferred list of capacitors by vendor.

#### **Output Capacitor**

The required output capacitance of the LMZ34002 can be comprised of either all ceramic capacitors, or a combination of ceramic and bulk capacitors. The required output capacitance must include at least  $2 \times 47 \mu F$  of ceramic type (or  $4 \times 22 \mu F$ ). The voltage rating of output capacitors must be greater than the output voltage. When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in Table 1 are required. Additional capacitance above the required minimum is determined by actual transient deviation requirements. Table 1 includes a preferred list of capacitors by vendor.

#### Table 1. Recommended Input/Output Capacitors (1)

			CAPACITOR CHARACTERISTICS			
VENDOR	SERIES	PART NUMBER	WORKING VOLTAGE (V)	CAPACITANCE (µF)	ESR <sup>(2)</sup> (mΩ)	
Murata	X5R	GRM31CR61H225KA88L	50	2.2	2	
TDK	X5R	C3216X5R1H475K	50	4.7	2

Maximum ESR @ 100 kHz, 25°C.

#### APPLICATION INFORMATION

#### **Adjusting the Output Voltage**

The LMZ34002 is designed to provide output voltages from -3 V to -17 V. The output voltage is determined by the value of  $R_{SET}$ , which must be connected between the VADJ pin (Pin 36) and GND. Table 2 gives the standard external  $R_{SET}$  resistor for a number of common bus voltages.

Table 2. Standard R<sub>SET</sub> Resistor Values for Common Output Voltages

OUTPUT VOLTAGE V <sub>OUT</sub> (V)	-3.3	-5.0	-8.0	-12.0	-15.0
R <sub>SET</sub> (kΩ)	31.6	52.3	90.9	140	178

For other output voltages the value of  $R_{\text{SET}}$  can be calculated using the following formula, or simply selected from the range of values given in Table 3.

$$R_{SET} = 10 \times \left( \frac{|V_{OUT}|}{0.798} - 1 \right) (k\Omega)$$
(1)

Table 3. Standard R<sub>SET</sub> Resistor Values

	Table of Classical Table 1									
V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)	V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)	V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)					
-3.0	27.4	-7.5	84.5	-12.5	147					
-3.3	31.6	-8.0	90.9	-13.0	154					
-3.5	34.0	-8.5	97.6	-13.5	158					
-4.0	40.2	-9.0	102	-14.0	165					
-4.5	46.4	-9.5	110	-14.5	174					
-5.0	52.3	-10.0	115	-15.0	178					
-5.5	59.0	-10.5	121	-15.5	187					
-6.0	64.9	-11.0	127	-16.0	191					
-6.5	71.5	-11.5	133	-16.5	196					
-7.0	78.7	-12.0	140	-17.0	205					

#### **Safe Operating Current**

Submit Documentation Feedback

The amount of output current that can safely be delivered by the LMZ34002 depends on the input voltage and the output voltage. Figure 33 shows the maximum output current for four standard output voltages over input voltage.

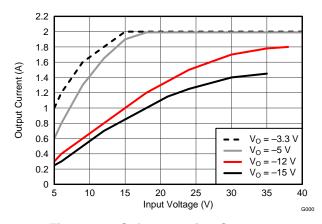

Figure 33. Safe Operating Current

#### **Application Schematics**

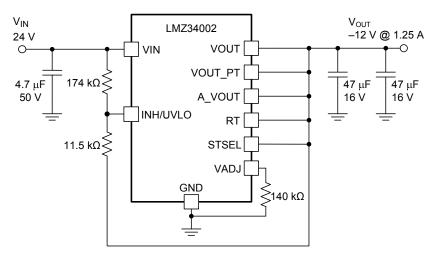

Figure 34. Typical Schematic  $V_{IN} = 24 \text{ V}, V_{OUT} = -12 \text{ V}$ 

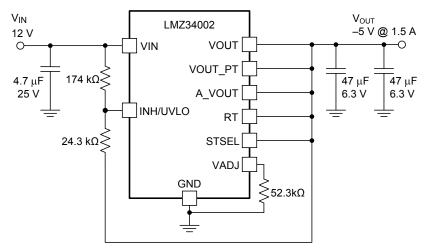

Figure 35. Typical Schematic  $V_{IN} = 12 \text{ V}, V_{OUT} = -5 \text{ V}$ 

#### Input Voltage

The LMZ34002 operates over the input voltage range of 4.5 V to 40 V. The maximum input voltage is 40 V, however, the sum of  $V_{IN}$  +  $|V_{OUT}|$  must not exceed 50 V.

See the Undervoltage Lockout (UVLO) Threshold section of this datasheet for more information.

#### **Undervoltage Lockout (UVLO) Threshold**

At turn-on, the  $V_{ON}$  UVLO threshold determines the input voltage level where the device begins power conversion.  $R_{UVLO1}$  and  $R_{UVLO2}$  set the turn-on threshold as shown in Figure 36. The UVLO threshold is not present during the power-down sequence. Applications requiring a turn-off threshold must monitor the input voltage with external circuitry and shut-down using the INH control (see Output On/Off Inhibit (INH)).

The  $V_{ON}$  UVLO threshold must be set to at least 4.5 V to insure proper start-up and reduce current surges on the host input supply as the voltage rises. If possible, it is recommended to set the UVLO threshold to appproximantely 80 to 85% of the minimum expected input voltage.

Use Equation 2 and Equation 3 to calculate the values of  $R_{UVLO1}$  and  $R_{UVLO2}$ .  $V_{ON}$  is the voltage threshold during power-up when the input voltage is rising. Table 4 lists standard resistor values for  $R_{UVLO1}$  and  $R_{UVLO2}$  for adjusting the  $V_{ON}$  UVLO threshold for several input voltages.

$$R_{UVLO1} = \frac{0.5}{2.9 \times 10^{-3}} (k\Omega)$$

$$R_{UVLO2} = \frac{1.25}{\left(\frac{(V_{ON} - 1.25)}{R_{UVLO1}}\right) + 0.9 \times 10^{-3}} (k\Omega)$$
(3)

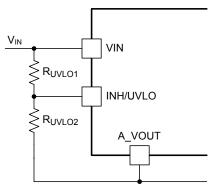

Figure 36. Adjustable VIN UVLO

Table 4. Standard Resistor Values to set Von UVLO Threshold

V <sub>ON</sub> THRESHOLD (V)	4.5	5.0	6.5	8.0	9.0	10.0	15.0	20.0	30.0
R <sub>UVLO1</sub> (kΩ)	174	174	174	174	174	174	174	174	174
R <sub>UVLO2</sub> (kΩ)	63.4	56.2	40.2	31.6	27.4	24.3	15.8	11.5	7.50

#### **Power-Up Characteristics**

When configured as shown in the application schematics, the LMZ34002 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay from the point that a valid input voltage is recognized. Figure 37 shows the start-up waveforms for a LMZ34002, operating from a 12 V input and the output voltage adjusted to –5 V. The waveform were measured with a 1.5-A constant current load.

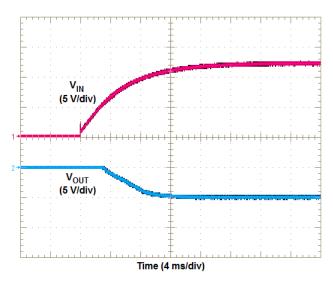

Figure 37. Start-Up Sequence

#### **Light-Load Behavior**

The LMZ34002 is a non-synchronous converter. One of the characteristics of non-synchronous operation is that as the output load current decreases, a point is reached where the energy delivered by a single switching pulse is more than the load can absorb. This energy causes the output voltage to rise slightly. This rise in output voltage is sensed by the feedback loop and the device responds by skipping one or more switching cycles until the output voltages falls back to the set point. At very light loads or no load, many switching cycles are skipped. The observed effect during this pulse skipping mode of operation is an increase in the peak to peak ripple voltage, and a decrease in the ripple frequency. The amount of load current when pulse skipping begins is a function of the input voltage, the output voltage, and the switching frequency.

#### **No-Load Operation**

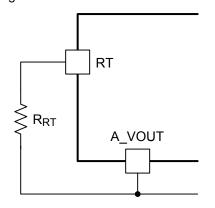

When operating at no load or very light load and the input voltage is removed, the output voltage discharges very slowly. If the input voltage is re-applied before the output voltage discharges, the slow-start circuit does not activate and the amount of inrush current is extremely large and may cause an over-current condition. To avoid this condition the output voltage must be allowed to discharge before re-applying the input voltage. Applying a 50-mA to 100-mA minimum load helps discharge the output voltage. Additionally, monitoring the input voltage with a supervisor and shuting-down using the INH control (see Output On/Off Inhibit (INH)) activates the internal slow-start circuit.

#### **Switching Frequency**

The recommended switching frequency of the LMZ34002 is 800 kHz. To operate at the recommended switching frequency, connect the RT pin (Pin 30) to A\_VOUT (at pin 32).

It is recommended to adjust the switching frequency in applications with both, higher input voltage (> 18V) and lower output voltage (< -8V). For these applications, improved operating performance can be obtained by decreasing the operating frequency to 500 kHz by adding a resistor,  $R_{RT}$  of 93.1 k $\Omega$  between the RT pin and A\_VOUT as shown in Figure 38. Figure 39 shows the recommended switching frequency over input voltage and output voltage.

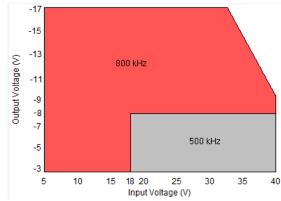

Figure 38. R<sub>RT</sub> Resistor Placement

Figure 39. Recommended Switching Frequency

**Table 5. Standard Resistor Values For Setting Switching Frequency** 

f <sub>SW</sub> (kHz)	500	800
$R_{RT}(k\Omega)$	93.1	0 (short)

#### Synchronization (CLK)

An internal phase locked loop (PLL) allows synchronization from 700 kHz to 900 kHz for 800 kHz applications, or 400 kHz to 600 kHz for 500 kHz applications. See Figure 39 to determine switching frequency based on input voltage and output voltage. To implement the synchronization feature, connect a square wave clock signal to the RT/CLK pin with a duty cycle between 25% to 75%. The clock signal amplitude must transition lower than 0.5 V and higher than 2.2 V. The start of the switching cycle is synchronized to the falling edge of RT/CLK pin. In applications requiring CLK mode, configure the device as shown in Figure 40 (800 kHz) and Figure 41 (500kHz).

Before the external clock is present, the device works in RT mode where the switching frequency is set by the  $R_{RT}$  resistor. When the external clock is present, the CLK mode overrides the RT mode. The first time the CLK pin is pulled above the RT/CLK high threshold (2.2 V), the device switches from RT mode to CLK mode and the CLK pin becomes high impedance as the PLL starts to lock onto the frequency of the external clock. It is not recommended to switch from CLK mode back to RT mode because the internal switching frequency drops to 100 kHz first before returning to the switching frequency set by the RT resistor.

#### **Output On/Off Inhibit (INH)**

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device. If an application requires controlling the INH pin, an external level-shifter is required to interface with the pin because in a positive-to-negative buck-boost supply, the INH pin is referenced to VOUT, not GND. Adding a level-shifter (U1) as shown in Figure 42, allows the INH control to be referenced to GND. A recommended level-shifter part # is DCX144EH-7 from Diodes Inc.

Pulling the input of U1 to GND applies a low voltage to the inhibit control pin and disables the output of the supply, shown in Figure 43. Releasing the input of U1 enables the device, which executes a soft-start power-up sequence, as shown in Figure 44. The device produces a regulated output voltage within 10 ms. The waveforms were measured with a 1.5-A constant current load.

#### Slow-Start Circuit (SS)

Connecting the STSEL pin (Pin 29) to A\_VOUT while leaving SS pin (Pin 28) open, enables the internal SS capacitor with a slow-start interval of approximately 10 ms. Adding additional capacitance between the SS pin and A\_VOUT increases the slow-start time. Figure 45 shows an additional SS capacitor connected to the SS pin and the STSEL pin connected to A VOUT. See Table 6 below for SS capacitor values and timing interval.

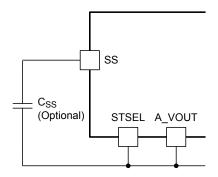

Figure 45. Slow-Start Capacitor (C<sub>SS</sub>) and STSEL Connection

Table 6. Slow-Start Capacitor Values and Slow-Start Time

C <sub>SS</sub> (nF)	open	10	15	22
SS Time (ms)	10	15	17	20

#### **Inrush Current**

During turn-on, as the LMZ34002 performs a slow-start sequence, an inrush current is induced as the output capacitors charge up. The inrush current is in addition to the DC input current. The amount of inrush current depends on the input voltage, output voltage and amount of output capacitance. Table 7 shows the typical inrush current for the input voltage, output voltage and the amount of output capacitance. Increasing the slow-start capacitor reduces the inrush current by slowing down the ramp of the output voltage. See Slow-Start Circuit (SS).

**Table 7. Typical Inrush Current** 

	Output Capacitance →	100 μF ceramic	200 μF <sup>(1)</sup>	320 μF <sup>(1)</sup>	430 μF <sup>(1)</sup>

	-15	0.3	0.3	0.5	0.7
	-3.3	0.2	0.2	0.2	0.2
36	-5	0.2	0.2	0.2	0.2
	-12	0.2	0.3	0.4	0.4

<sup>(1)</sup> This amount of capacitance includes the required 100 µF of ceramic capacitance with additional bulk capacitance.

#### **Input to Output Coupling Capacitor**

Adding an input to output coupling capacitor ( $C_{IO}$ ) across VIN to VOUT as shown in Figure 46 can help reduce output voltage ripple and improve transient response. A typical value for  $C_{IO}$  is 2.2  $\mu$ F ceramic with a voltage rating greater than the sum of VIN + |VOUT|.

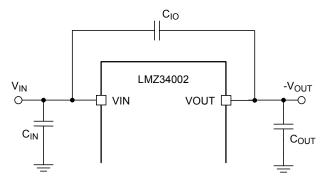

Figure 46. Input to Output Coupling Capacitor

#### **Overcurrent Protection**

For protection against load faults, the LMZ34002 incorporates cycle-by-cycle current limiting. During an overcurrent condition the output current is limited and the output voltage is reduced. If the output voltage drops more than 25%, the switching frequency is lowered to reduce power dissipation within the device. When the overcurrent condition is removed, the output voltage returns to the established voltage.

The LMZ34002 is not designed to endure a sustained short circuit condition. The use of an output fuse, voltage supervisor circuit, or other overcurrent protection circuit is recommended.

#### Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 180°C typically. The device reinitiates the power up sequence when the junction temperature drops below 165°C typically.

#### **Layout Considerations**

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 47 through Figure 50 show four layers of a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and GND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the module pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Place a dedicated A VOUT copper area beneath the LMZ34002.
- Isolate the PH copper area from the GND copper area using the VOUT copper area.
- Connect the VOUT and A VOUT copper areas at one point; at pins 8 & 9.
- Place R<sub>SET</sub>, R<sub>RT</sub>, and C<sub>SS</sub> as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.
- Use a dedicated sense line to connect R<sub>SET</sub> to GND near the load for best regulation.

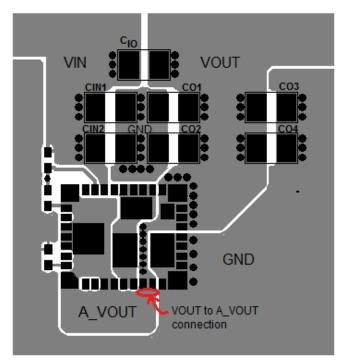

Figure 47. Typical Top-Layer Recommended Layout

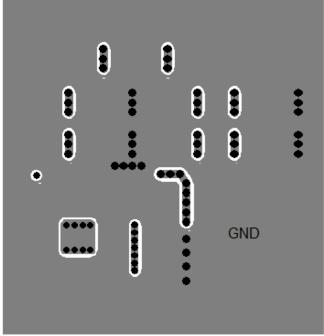

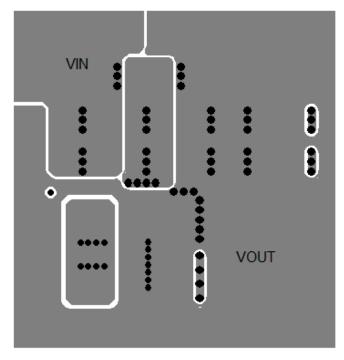

Figure 48. Typical GND-Layer Recommended Layout

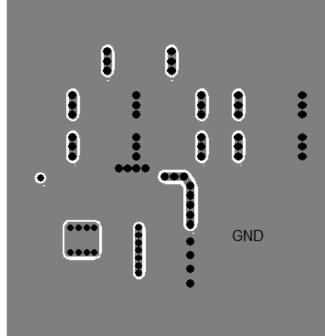

Figure 49. Typical VOUT-Layer Recommended Layout

Figure 50. Typical Bottom-Layer Recommended Layout

#### **EMI**

The LMZ34002 complies with EN55022 Class B radiated emissions. Figure 51 shows a typical example of radiated emissions plots for the LMZ34002. The graph includes the plot of the antenna in the horizontal and vertical positions.

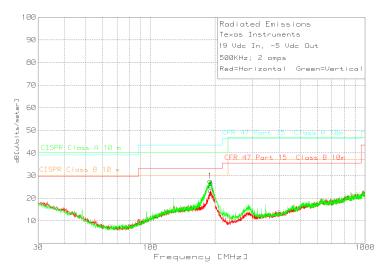

Figure 51. Radiated Emissions 19-V Input, -5-V Output, 2-A Load (EN55022 Class B)

#### **PACKAGING INFORMATION**

Orderable Device	Status	Package Type	Package Drawing	Pins	Package Qty	Eco Plan	Lead/Ball Finish	MSL Peak Temp	Op Temp (°C)	Device Marking	Samples
LMZ34002RKGR	ACTIVE	B1QFN	RKG	41	500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	(54260 ~ LMZ34002)	Samples
LMZ34002RKGT	ACTIVE	B1QFN	RKG	41	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	(54260 ~ LMZ34002)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

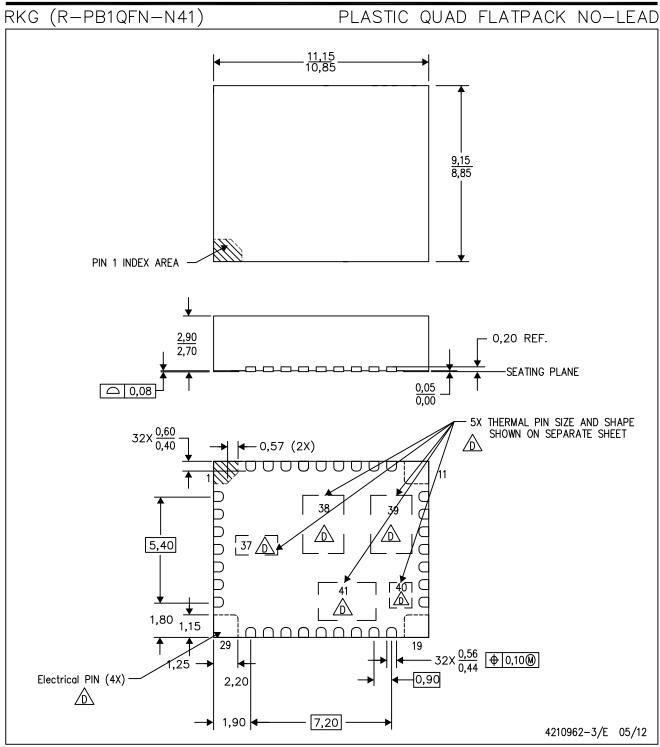

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

#### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

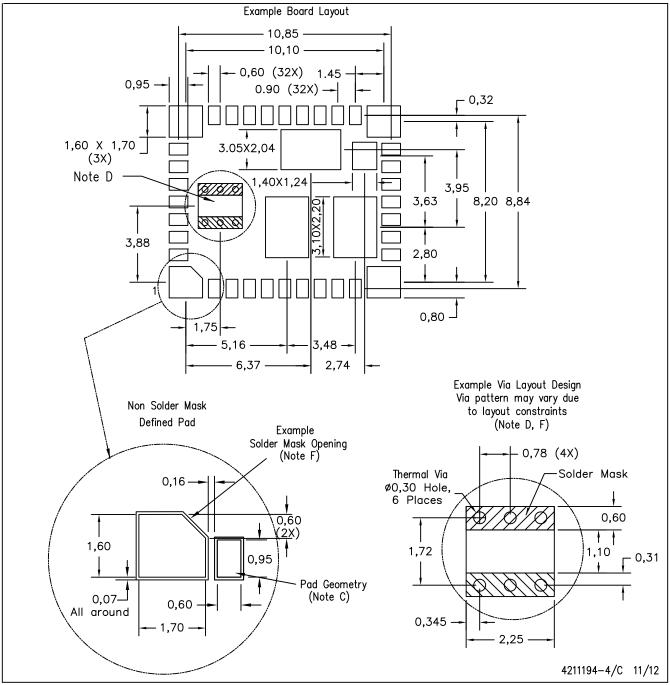

The exposed thermal pad dimensions for this package are shown in the following illustration.

#### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
