

FEATURES

- Member of the Texas Instruments Widebus™ Family
- **UBE™ (Universal Bus Exchanger) Allows Synchronous Data Exchange**
- Operates From 1.65 V to 3.6 V
- Max t_{pd} of 5.1 ns at 3.3 V
- ± 24 -mA Output Drive at 3.3 V
- Bus Hold on Data Inputs Eliminates the Need for External Pullup/Pulldown Resistors
- Latch-Up Performance Exceeds 250 mA Per JESD 17
- ESD Performance Tested Per JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)

DESCRIPTION/ORDERING INFORMATION

This 9-bit, 4-port universal bus exchanger is designed for 1.65-V to 3.6-V V_{CC} operation.

The SN74ALVCH16409 allows synchronous data exchange between four different buses. Data flow is controlled by the select (SEL0–SEL4) inputs. A data-flow state is stored on the rising edge of the clock (CLK) input if the select-enable (SELEN) input is low. Once a data-flow state has been established, data is stored in the flip-flop on the rising edge of CLK if SELEN is high.

The data-flow control logic is designed to allow glitch-free data transmission.

When preset ($\overline{PRE}$) transitions high, the outputs are disabled immediately, without waiting for a clock pulse. To leave the high-impedance state, both $\overline{PRE}$ and SELEN must be low, and a clock pulse must be applied.

To ensure the high-impedance state during power up or power down, $\overline{PRE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) This value is limited to 4.6 V maximum.
- (4) The package thermal impedance is calculated in accordance with JESD 51-7.
